## Part II

### Nuclear Regulatory Commission

---

State of Utah; Staff Assessment of  
Proposed Agreement Between the NRC  
and the State of Utah; Notice

## NUCLEAR REGULATORY COMMISSION

### State of Utah; Staff Assessment of Proposed Agreement Between the NRC and the State of Utah

**Note.**—This document was originally published on Friday, December 30, 1983 at 48 FR 57674. It is reprinted at the request of the Nuclear Regulatory Commission.

**AGENCY:** Nuclear Regulatory Commission.

**ACTION:** Notice of Proposed Agreement with State of Utah.

**SUMMARY:** Notice is hereby given that the U.S. Nuclear Regulatory Commission is publishing for public comment the NRC staff assessment of a proposed agreement received from the Governor of the State of Utah for the assumption of certain of the Commission's regulatory authority pursuant to Section 274 of the Atomic Energy Act of 1954, as amended.

A staff assessment of the State's proposed program for control over sources of radiation is set forth below as supplementary information to this notice. A copy of the program narrative, including the referenced appendices, appropriate State legislation and Utah regulations, is available for public inspection in the Commission's public document room at 1717 H Street, NW., Washington, D.C. Exemptions from the Commission's regulatory authority, which would implement this proposed agreement, have been published in the *Federal Register* and codified as Part 150 of the Commission's regulations in Title 10 of the Code of Federal Regulations.

**DATE:** Comments must be received on or before January 30, 1984.

**ADDRESSES:** All interested persons desiring to submit comments and suggestions for consideration by the Commission in connection with the proposed agreement should send them to the Office of State Programs, U.S. Nuclear Regulatory Commission, Washington, D.C. 20555.

**FOR FURTHER INFORMATION CONTACT:** John R. McGrath, Office of State Programs, U.S. Nuclear Regulatory Commission, Washington, D.C. 20555, telephone: 301-492-9889, or Robert J. Doda, U.S. Nuclear Regulatory Commission, Region IV, 611 Ryan Plaza Drive, Suite 1000, Arlington, Texas, 76011, telephone 817-860-8139.

**SUPPLEMENTARY INFORMATION:** Assessment of Proposed Utah Program to Regulate Certain Radioactive Materials Pursuant to Section 274 of the Atomic Energy Act of 1954, as amended.

The Commission has received a proposal from the Governor of Utah for the State to enter into an agreement with the NRC whereby the NRC would relinquish and the State would assume certain regulatory authority pursuant to Section 274 of the Atomic Energy Act of 1954, as amended.

Section 274e of the Atomic Energy Act of 1954, as amended, requires that the terms of the proposed agreement be published for public comment once each week for four consecutive weeks. Accordingly, this notice will be published four times in the *Federal Register*.

#### I. Background

A. Section 274 of the Atomic Energy Act of 1954, as amended, provides a mechanism whereby the NRC may transfer to the States certain regulator authority over agreement materials<sup>1</sup> when a State desires to assume this authority and the Governor certifies that the State has an adequate regulatory program, and when the Commission finds that the State's program is compatible with that of the NRC and is adequate to protect the public health and safety. Section 274g directs the Commission to cooperate with the States in the formulation of standards for protection against radiation hazards to assure that State and Commission programs for radiation protection will be coordinated and compatible. Further, Section 274j provides that the Commission shall periodically review such agreements and actions taken by the States under the agreements to ensure compliance with the provisions of this section.

B. In a letter dated November 14, 1983, Governor Scott M. Matheson of the State of Utah requested that the Commission enter into an agreement with the State pursuant to Section 274 of the Atomic Energy Act of 1954, as amended, and proposed that the agreement become effective on April 1, 1984. The Governor certified that the State of Utah has a program for control of radiation hazards which is adequate to protect the public health and safety with respect to the materials within the State covered by the proposed agreement, and that the State of Utah desires to assume regulatory responsibility for such materials. The text of the proposed agreement is shown in Appendix A and the narrative portion

of the program description is shown in Appendix B.

The specific authority requested is for (1) byproduct material as defined in Section 11e(1) of the Act, (2) source material and (3) special nuclear material in quantities not sufficient to form a critical mass. The State does not wish to assume authority over uranium milling activities nor the commercial disposal of low-level radioactive waste. The State, however, reserves the right to apply at a future date to NRC for an amended agreement to assume authority in these areas. The nine articles of the proposed agreement cover the following areas:

- I. Lists the materials covered by the agreement.
- II. Lists the Commission's continue authority and responsibility for certain activities.
- III. Allows for future amendment of the agreement.
- IV. Allows for certain regulatory changes by the Commission.
- V. References the continued authority of the Commission for common defense and security for safeguards purposes.
- VI. Pledges the best efforts of the Commission and the State to achieve coordinated and compatible programs.
- VII. Recognizes reciprocity of licenses issued by the respective agencies.
- VIII. Sets forth criteria for termination or suspension of the agreement.
- IX. Specifies the effective date of the agreement.

C. Utah Code Annotated 26-1-27 through 26-1-29 authorizes the State Department of Health to issue licenses to, and perform inspections of, users of radioactive materials under the proposed agreement and otherwise carry out a total radiation control program. Utah Radiation Control Regulations URC-10 through URC-80 adopted November 8, 1982 under authority of 26-1-27 through 26-1-29 Utah Code annotated 1953, as amended, provides standards, licensing, inspection, enforcement and administrative procedures for agreement and non-agreement materials. Pursuant to URC-12-165, the regulations are not applicable to agreement materials until the effective date of the agreement. Since January 1, 1983, the State has been licensing and inspecting users of naturally occurring and accelerator produced radioactive materials.

D. The environmental radiation issues with which the Department has been involved include: monitoring assessment of the impact of radioactive fallout from nuclear weapons testing at the Nevada Test Site; monitoring uranium mill tailings, particularly at the Vitro uranium mill; and monitoring indoor radon in Salt Lake County.

<sup>1</sup> A. Byproduct materials as defined in 11e(1);

B. Byproduct materials as defined in 11e(2);

C. Source materials; and

D. Special nuclear materials in quantities not sufficient to form a critical mass.

The Department has also been involved in inspections of x-ray users since 1961 including involvement in the U.S. FDA studies Nationwide Evaluation of X-Ray Trends (NEXT) and Dental Exposure Normalization Technique (DENT).

## II. NRC Staff Assessment of Proposed Utah Program for Control of Agreement Materials

Reference: Criteria for Guidance of States and NRC in Discontinuance of NRC Regulatory Authority and Assumption Thereof by States Through Agreement.<sup>2</sup>

### Objectives

1. *Protection.* A State regulatory program shall be designed to protect the health and safety of the people against radiation hazards.

Based upon the analysis of the State's proposed regulatory program the staff believes the Utah proposed regulatory program for agreement materials is adequately designed to protect the health and safety of the public against radiation hazards.

### Radiation Protection Standards

2. *Standards.* The State regulatory program shall adopt a set of standards for protection against radiation which shall apply to byproduct, source and special nuclear materials in quantities not sufficient to form a critical mass.

Statutory authority to formulate and promulgate rules for controlling exposure to sources of radiation is contained in Utah Code Annotated 26-1-5 and 26-1-27. In accordance with that authority, the State has adopted Radiation Control Regulations on November 8, 1982 which include radiation protection standards which would apply to by product, source and special nuclear materials in quantities not sufficient to form a critical mass upon the effective date of an agreement between the State and the Commission pursuant to Section 274b of the Atomic Energy Act of 1954 as amended.

Reference: Utah Radiation Control Regulations URC-10 through 80.

3. *Uniformity in Radiation Standards.* It is important to strive for uniformity in technical definitions and terminology, particularly as related to such things as units of measurement and radiation dose. There shall be uniformity on maximum permissible doses and level of radiation and concentrations of radioactivity, as fixed by 10 CFR Part 20 of the NRC regulations based on

officially approved radiation protection guides.

Technical definitions and terminology contained in the Utah Radiation Control Regulations including those related to units of measurement and radiation doses are uniform with those contained in 10 CFR Part 20, except that the definition of byproduct material conforms to that contained in the Atomic Energy Act prior to enactment by Congress of Pub. L. 95-604, 92 Stat. 3021 et seq., November 8, 1978, the Uranium Mill Tailings Radiation Control Act of 1978 (UMTRCA). In view of the fact that the State does not wish to assume authority over uranium milling activities pursuant to UMTRCA the absence of a definition of byproduct material conforming to that contained in Section 11e(2) of the Atomic Energy Act of 1954, as amended, is not viewed as a significant departure and should not be considered an impediment towards signing of a Section 274b agreement for the materials requested.

Reference: URC-12, 24.

4. *Total Occupational Radiation Exposure.* The regulatory authority shall consider the total occupational radiation exposure of individuals, including that from sources which are not regulated by it.

The Utah regulations cover all sources of radiation within the State's jurisdiction and provide for consideration of the total radiation exposure of individuals from all sources of radiation in the possession of a licensee or registrant.

Reference: URC-24-010,020.

5. *Surveys, Monitoring.* Appropriate surveys and personnel monitoring under the close supervision of technically competent people are essential in achieving radiological protection and shall be made in determining compliance with safety regulations.

The Utah requirements for surveys to evaluate potential exposure from sources of radiation and the personnel monitoring requirements are uniform with those contained in 10 CFR Part 20.

References: URC-12-050 (36) and (82), URC-12-100, URC-24-070, and URC-24-085.

6. *Labels, Signs, Symbols.* It is desirable to achieve uniformity in labels, signs, and symbols, and the posting thereof. However, it is essential that there be uniformity in labels, signs, and symbols affixed to radioactive products which are transferred from person to person.

The prescribed radiation labels, signs, and symbols are uniform with those contained in 10 CFR Parts 20, 30 thru 32

and 34. The Utah posting requirements are also uniform with those of Part 20.

References: URC-22-110, URC-24-090, URC-24-095, and URC-48-020.

7. *Instruction.* Persons working in or frequenting restricted areas shall be instructed with respect to the health risks associated with exposure to radioactive materials and in precautions to minimize exposure. Workers shall have the right to request regulatory authority inspections as per 10 CFR 19, Section 19.16 and to be represented during inspections as specified in Section 19.14 of 10 CFR 19.

The Utah regulations contain requirements for instructions and notices to workers that are uniform with those of 10 CFR Part 19.

Reference: URC-48.

8. *Storage.* Licensed radioactive material in storage shall be secured against unauthorized removal.

The Utah regulations contain a requirement for security of stored radioactive material.

Reference: URC-24-120.

9. *Radioactive Waste Disposal.* (a) Waste disposal by material users. The standards for the disposal of radioactive material into the air, water and sewer, and burial in the soil shall be in accordance with 10 CFR Part 20. Holders of radioactive material desiring to release or dispose of quantities or concentrations of radioactive materials in excess of prescribed limits shall be required to obtain special permission from the appropriate regulatory authority.

Requirements for transfer of waste for the purpose of ultimate disposal at a land disposal facility (waste transfer and manifest system) shall be in accordance with 10 CFR 20.

The waste disposal standards shall include a waste classification scheme and provisions for waste form, applicable to waste generators, that is equivalent to that contained in 10 CFR Part 61.

(b) Land Disposal of waste received from other persons. The State shall promulgate regulations containing licensing requirements for land disposal of radioactive waste received from other persons which are compatible with the applicable technical definitions, performance objectives, technical requirements and applicable supporting sections set forth in 10 CFR Part 61. Adequate financial arrangements (under terms established by regulation) shall be required of each waste disposal site licensee to ensure sufficient funds for decontamination, closure and

<sup>2</sup> NRC Statement of Policy published in the Federal Register January 23, 1981 (46 FR 7540-7546), and revision of Criterion 9 published in the Federal Register July 21, 1983 (48 FR 33376).

stabilization of a disposal site. In addition, Agreement State financial arrangements for long-term monitoring and maintenance of a specific site must be reviewed and approved by the Commission prior to relieving the site operator of licensed responsibility (Section 151(a)(2), Pub. L. 97-425).

Utah Radiation Control Regulations contain provisions relating to the disposal of radioactive materials into the air, water and sewer and burial in soil which are uniform with those of 10 CFR Part 20. The current Utah regulations were adopted prior to the publication of 10 CFR Part 61 and the corresponding changes to § 20.311 of Part 20. The Utah regulations, therefore, have no equivalent to § 20.311 or the waste classification system included in Part 61. Governor Matheson's letter of November 14, 1983 indicated that the State's radiation control regulations will be revised through standard rulemaking procedures to conform to the Federal standard regarding the radioactive waste manifest system and the waste classification system.

Since the waste manifest system does not become effective until December 27, 1983 and Agreement States are normally given three years to formally adopt significant changes to NRC regulations, the absence of these provisions in Utah regulations is not viewed as a significant deficiency at this time and should not be considered an impediment to the proposed agreement. The waste manifest system will be implemented by amendments to the site operator licenses. Utah, as well as other Agreement State, licensees will be required to meet the provisions of the site operator's license if they wish to use the site after December 27, 1983.

References: URC-24-130, 135, 140, 145, 150 and 160.

**10. Regulation Governing Shipment of Radioactive Materials.** The State shall to the extent of its jurisdiction promulgate regulations applicable to the shipment of radioactive materials, such regulations to be compatible with those established by the U.S. Department of Transportation and other agencies of the United States whose jurisdiction over interstate shipment of such materials necessarily continues. State regulations regarding transportation of radioactive materials must be compatible with 10 CFR Part 71.

The Utah regulations conform to those contained in NRC regulations prior to the recent (August 5, 1983) publication of a final rule amending Part 71 to achieve compatibility with the transport regulations of the International Atomic Energy Agency (IAEA). The Agreement

States have been notified that these changes are considered matters of compatibility. Utah, as well as the other Agreement States, will need to make corresponding changes to their regulations. The lack of these provisions in the current Utah regulations is not viewed as a significant departure at this time since Agreement States are normally given three years to adopt important NRC rule changes, and should not be considered an impediment to the proposed agreement.

References: URC-12-Appendix A and Appendix B; URC-19-400, 500 and 510.

**11. Records and Reports.** The State regulatory program shall require that holders and users of radioactive materials (a) maintain records covering personnel radiation exposures, radiation surveys, and disposals of materials; (b) keep records of the receipt and transfer of the materials; (c) report significant incidents involving the materials, as prescribed by the regulatory authority; (d) make available upon request of a former employee a report of the employee's exposure to radiation; (e) at request of an employee advise the employee of his or her annual radiation exposure; and (f) inform each employee in writing when the employee has received radiation exposure in excess of the prescribed limits.

The Utah regulations require the following records and reports by licensees and registrants:

(a) Records covering personnel radiation exposures, radiation surveys, and disposals of materials.

Reference: URC-24-170.

(b) Records of receipt and transfer of materials.

Reference: URC-12-080.

(c) Reports concerning incidents involving radioactive materials.

Reference: URC-24-180, 190, 200, and 205.

(d) Reports to former employees of their radiation exposure.

Reference: URC-48-040(3).

(e) Reports to employees of their annual radiation exposure.

Reference: URC-48-040(2).

(f) Reports to employees of radiation exposure in excess of prescribed limits.

Reference: URC-48-040(4).

**12. Additional Requirements and Exemptions.** Consistent with the overall criteria here enumerated and to accommodate special cases and circumstances, the State regulatory authority shall be authorized in individual cases to impose additional requirements to protect health and

safety, or to grant necessary exemptions which will not jeopardize health and safety.

The Utah Bureau of Radiation Control is authorized to impose upon any licensee or registrant, by rule, regulation, or order such requirements in addition to those established in the regulations as it deems appropriate or necessary to minimize danger to public health and safety or property.

Reference: URC-12-100(2).

The Bureau may also grant such exemptions from the requirements of the regulations as it determines are authorized by law and will not result in undue hazard to public health and safety or property.

Reference: URC-12-125(1).

**Prior Evaluation of Uses of Radioactive Materials**

**13. Prior Evaluation of Hazards and Uses, Exceptions.** In the present state of knowledge, it is necessary in regulating the possession and use of byproduct, source and special nuclear materials that the State regulatory authority require the submission of information on, and evaluation of, the potential hazards and the capability of the user or possessor prior to his receipt of the materials. This criterion is subject to certain exceptions and to continuing reappraisal as knowledge and experience in the atomic energy field increase. Frequently there are, and increasingly in the future there may be, categories of materials and uses as to which there is sufficient knowledge to permit possession and use without prior evaluation of the hazards and the capability of possessor and user. These categories fall into two groups—those materials and uses which may be completely exempt from regulatory controls, and those materials and uses in which sanctions for misuse are maintained without pre-evaluation of the individual possession or use. In authorizing research and development or other activities involving multiple uses of radioactive materials, where an institution has people with extensive training and experience, the State regulatory authority may wish to provide a means for authorizing broad use of materials without evaluating each specific use.

Prior to the issuance of a specific license for the use of radioactive materials, the Utah Bureau of Radiation Control will require the submission of information on, and will make an evaluation of, the potential hazards of such uses, and the capability of the applicant.

References: URC-19-220 and URC-22-020. Utah Program Description Section III.F.

Provision is made for the issuance of general licenses for byproduct, source and special nuclear materials in situations where prior evaluation of the licensee's qualifications, facilities, equipment and procedures is not required. The regulations grant general licenses under the same circumstances as those under which general licenses are granted in the Commission's regulations.

References: URC-19-220 and URC-21.

**14. Evaluation Criteria.** In evaluating a proposal to use radioactive materials, the regulatory authority shall determine the adequacy of the applicant's facilities and safety equipment, his training and experience in the use of the materials for the purpose requested, and his proposed administrative controls. States should develop guidance documents for use by license applicants. This guidance should be consistent with NRC licensing and regulatory guides for various categories of licensed activities.

In evaluating a proposal to use agreement materials, the Utah Bureau of Radiation Control will determine that:

(1) The applicant is qualified by reason of training and experience to use the material in question for the purpose requested in accordance with the regulations in such a manner as to minimize danger to public health and safety or property;

(2) The applicant's proposed equipment, facilities, and procedures are adequate to minimize danger to public health and safety or property; and

(3) The issuance of the license will not be inimical to the health and safety of the public.

Other special requirements for the issuance of specific licenses are contained in the regulations.

References: URC-22-040, 070, 090, and 110.

**15. Human Use.** The use of radioactive materials and radiation on or in humans shall not be permitted except by properly qualified persons (normally licensed physicians) possessing prescribed minimum experience in the use of radioisotopes or radiation.

The Utah regulations require that the use of radioactive material (including sealed sources) on or in humans shall be by a physician having substantial experience in the handling and administration of radioactive material and, where applicable, the clinical management of radioactive patients.

Reference: URC-22-070

## Inspection

**16. Purpose, Frequency.** The possession and use of radioactive materials shall be subject to inspection by the regulatory authority and shall be subject to the performance of tests, as required by the regulatory authority. Inspection and testing is conducted to determine and to assist in obtaining compliance with regulatory requirements. Frequency of inspection shall be related directly to the amount and kind of material and type of operation licensed, and it shall be adequate to insure compliance.

Utah materials licensees will be subject to inspection by the Bureau of Radiation Control. Upon instruction from the Bureau, licensees shall perform or permit the Bureau to perform such reasonable tests and surveys as the Bureau deems appropriate or necessary. The frequency of inspections is dependent upon the type and scope of the licensed activities and will be at least as frequent, and in most cases more frequent, as inspections of similar licenses by NRC.

References: URC-12-090 and 100; URC-48-050-060-070 and 080; Utah Program Description Section III.G

**17. Inspections Compulsory.** Licensees shall be under obligation by law to provide access to inspectors. Folios 807-809 §118.0

Utah regulations state that licensees shall afford the Bureau at all reasonable times opportunity to inspect sources of radiation and the premises and facilities wherein such sources of radiation are used or stored.

Reference: URC-12-090.

**18. Notification of Results of Inspection.** Licensees are entitled to be advised of the results of inspections and to notice as to whether or not they are in compliance.

Following Bureau inspections, each licensee will be notified by letter of the results of the inspection. The letters indicate if the licensee is in compliance and if not, list the areas of noncompliance.

Reference: Utah Program Description Section III.H.

## Enforcement

**19. Enforcement.** Possession and use of radioactive materials should be amenable to enforcement through legal sanctions, and the regulatory authority shall be equipped or assisted by law with the necessary powers for prompt enforcement. This may include, as appropriate, administrative remedies looking toward issuance of orders requiring affirmative action or

suspension or revocation of the right to possess and use materials, and the impounding of materials; the obtaining of injunctive relief; and the imposing of civil or criminal penalties.

The Bureau of Radiation Control is equipped with the necessary powers for prompt enforcement of the regulations. Where conditions exist that create a clear presence of a hazard to the public health that requires immediate action to protect human health and safety, the Bureau may issue orders to reduce, discontinue or eliminate such conditions. Such orders may be a written directive to modify, suspend or revoke a license, to cease and desist from a given practice or activity, or to take such other action as may be appropriate. License modification orders will be issued when some change in licensee equipment, procedures, or management controls is necessary. Suspension orders will be used to remove an immediate threat to the public health or when a licensee has not responded adequately to other enforcement action. Revocation orders will be used when a licensee is unable or unwilling to comply with Bureau requirements. Cease and desist orders will be used to stop an unauthorized activity that has continued despite notification by the Bureau that such activity is unauthorized. In addition, the State will request from the legislature authority to impose civil penalties for violation of the Utah Radiation Control Regulations.

References: URC-12-130 and 140, Utah Program Description Section III.H., and Governor Matheson's letter dated November 14, 1983.

## Personnel

**20. Qualifications of Regulatory and Inspection Personnel.** The regulatory agency shall be staffed with sufficient trained personnel. Prior evaluation of applications for licenses or authorizations and inspection of licensees must be conducted by persons possessing the training and experience relevant to the type and level of radioactivity in the proposed use to be evaluated and inspected.

To perform the functions involved in evaluation and inspection, it is desirable that there be personnel educated and trained in the physical and/or life sciences, including biology, chemistry, physics and engineering, and that the personnel have had training and experience in radiation protection. The person who will be responsible for the actual performance of evaluation and inspection of all of the various uses of byproduct, source and special nuclear

material which might come to the regulatory body should have substantial training and extensive experience in the field of radiation protection.

It is recognized that there will also be persons in the program performing a more limited function in evaluation and inspection. These persons will perform the day-to-day work of the regulatory program and deal with both routine situations as well as some which will be out of the ordinary. These people should have a bachelor's degree or equivalent in the physical or life sciences, training in health physics, and approximately two years of actual work experience in the field of radiation protection.

The foregoing are considered desirable qualifications for the staff who will be responsible for the actual performance of evaluation and inspection. In addition, there will probably be trainees associated with the regulatory program who will have an academic background in the physical or life sciences as well as varying amounts of specific training in radiation protection but little or no actual work experience in this field. The background and specific training of these persons will indicate to some extent their potential role in the regulatory program. These trainees, of course, could be used initially to evaluate and inspect those applications of radioactive materials which are considered routine or more standardized from the radiation safety standpoint, for example, inspection of industrial gauges, small research programs, and diagnostic medical programs. As they gain experience and competence in the field, the trainees could be used progressively to deal with the more complex or difficult types of radioactive material applications. It is desirable that such trainees have a bachelor's degree or equivalent in the physical or life sciences and specific training in radiation protection. In determining the requirement for academic training of individuals in all of the foregoing categories, proper consideration should be given to equivalent competency which has been gained by appropriate technical and radiation protection experience.

It is recognized that radioactive materials and their uses are so varied that the evaluation and inspection functions will require skills and experience in the different disciplines which will not always reside in one person. The regulatory authority should have the composite of such skills either in its employ or at its command, not only for routine functions, but also for emergency cases.

a. *Number of Personnel.* There are approximately 150 NRC specific licenses

in the State of Utah. Under the proposed agreement, the State would assume responsibility for about 135 of these licenses. The Bureau of Radiation Control is currently staffed with five professional persons. In addition, there is currently one vacancy in the program. Two individuals will be assigned full time to the materials program. Three others will be trained to provide backup. We estimate the State will need to apply a minimum of 1.4 to 2.0 staff-years of effort to the program. The present personnel together with their assigned responsibilities are as follows:

*Larry F. Anderson:* Director, Bureau of Radiation Control. Responsible for administration of Bureau programs. Estimated 0.2 staff-year in materials program.

*Blaine Howard:* Health Physicist. Responsible for licensing and inspection in materials program. Estimated 1.0 staff-year in materials program.

*Arnold J. Peart:* Radiation Specialist 23. Responsible for licensing and inspection in materials program. Estimated 1.0 staff-year in materials program.

*Donald G. Mitchell:* Health Physicist. Responsibilities primarily in x-ray program. Will receive training in licensing and inspection in materials program. Estimated 0.1 staff-year in materials program.

*Gerald R. Ripley:* Health Physicist. Responsibilities primarily in x-ray program. Will receive training in licensing and inspection in materials program. Estimated 0.1 staff-year in materials program.

b. *Training.* The academic and specialized short course training for those persons involved in the administration, licensing and inspection of radioactive materials is shown below.

*Larry F. Anderson—B.S. Chemistry, MPA (Health), Brigham Young University. NIOSH Course 549, Recognition, Evaluation, and Control of Occupational Hazards. October, 1972.*

*NIOSH Course 582, Sampling and Evaluating Airborne Asbestos Dust. April 10-12, 1973.*

*Utah State Division of Health, Visible Emissions Evaluation Course. June 19, 1973.*

*American Industrial Hygiene Association, Industrial Toxicology Seminar. A 24-hour course ending April 30, 1975.*

*OSHA, Fundamentals of Occupational Injury Investigation. Short course ending April 1, 1977.*

*United States Nuclear Regulatory Commission, Radiological Emergency Response Operations Training Course. A 64-hour course ending January 27, 1978.*

*Gerald R. Ripley—B.S. Biology, University of Utah. B.S. Pharmacy, University of Utah.*

c. *Experience.* Mr. Anderson has been with the Bureau since 1972 and has had supervisory and administration responsibilities since 1978. Mr. Howard has been a health physicist with the State since 1972 and has had experience in health physics since 1954. Mr. Howard was certified by the American

Board of Health Physics in 1978. Mr. Peart has been employed by the State since 1975, from 1975 to 1982 as an industrial hygienist and from 1982 as a radiation specialist. Messrs. Howard and Peart have accompanied NRC inspectors on materials inspections in the State of Utah. Mr. Mitchell has been a health physicist with the State since 1975. Prior to 1975 Mr. Mitchell had experience as a radiochemist and a teacher of chemistry and physics. Mr. Ripley has been a health physicist and industrial hygienist with the State since 1979. Mr. Ripley has prior experience as a radiochemist and pharmacist.

Reference: Utah Program Description Section IV and Appendix B.

**21. Conditions Applicable to Special Nuclear Materials, Source Material and Tritium.** Nothing in the State's regulatory program shall interfere with the duties imposed on the holder of the materials by the NRC, for example, the duty to report to the NRC, on NRC prescribed forms (1) transfers of special nuclear material, source material and tritium and (2) periodic inventory data.

The State's regulations do not prohibit or interfere with the duties imposed by the NRC on holders of special nuclear material owned by the U.S. Department of Energy or licensed by NRC, such as the responsibility of licensees to supply to the NRC reports of transfer and inventory.

Reference: URC-12-040 and 125.

**22. Special Nuclear Material Defined.** The definition of special nuclear material in quantities not sufficient to form a critical mass, as contained in the Utah Radiation Control Regulations, is uniform with the definition in 10 CFR Part 150.

Reference URC-12-050, Definition (60).

#### Administration

**23. Fair and Impartial Administration.** The Utah Health Code provides for administrative and judicial review of actions taken by the Department of Health. Any person may, upon written request, be given an opportunity for an informal hearing before the Department. If the matter cannot be resolved at the informal hearing, the person may then request a hearing before an impartial hearing officer. The person may then file in the district court for judicial review of a final determination of the executive director of the Department.

Reference: Utah Health Code Section 26-23-2.

**24. State Agency Designation.** The Utah Department of Health has been designated as the State's radiation control agency.

References: Utah Health Code 26-1-28. Governor's Matheson's letter dated November 14, 1983.

**25. Existing NRC Licenses and Pending Applications.** The Bureau has made provision to continue NRC licenses in effect temporarily after the transfer of jurisdiction. Such licenses will expire either 90 days after receipt from the Bureau of a notice of expiration or on the date of expiration specified in the federal license, whichever is earlier.

Reference: URC-12-165.

**26. Relations With Federal Government and Other States.** There should be an interchange of Federal and State information and assistance in connection with the issuance of regulations and licenses or authorizations, inspection of licensees, reporting of incidents and violations, and training and education problems.

The proposed agreement declares that the State will use its best efforts to cooperate with the NRC and other Agreement States in the formulation of standards and regulatory programs for the protection against hazards of radiation and to assure that the State's program will continue to be compatible with the Commission's program for the regulation of like materials.

Reference: Governor Matheson's letter dated November 14, 1983, Proposed Agreement Between the State of Utah and the Nuclear Regulatory Commission, Article VI.

**27. Coverage, Amendments, Reciprocity.** The proposed Utah agreement provides for the assumption of regulatory authority under the following categories of materials within the State:

(a) Byproduct materials, as defined by Section 11e(1) of the Atomic Energy Act, as amended.

(b) Source materials.

(c) Special nuclear materials in quantities not sufficient to form a critical mass.

Reference: Proposed Agreement, Article I.

Provision has been made by Utah for the reciprocal recognition of licenses to permit activities within Utah of persons licensed by other jurisdictions. This reciprocity is like that granted under 10 CFR Part 150.

Reference: URC-19-250.

**28. NRC and Department of Energy Contractors.** The State's regulations provide that certain NRC and DOE contractors or subcontractors are exempt from the State's requirements for licensing and registration of sources of radiation which such persons receive, possess, use, transfer, or acquire.

Reference: URC-12-125(2).

#### III. Staff Conclusion

Section 274d of the Atomic Energy Act of 1954, as amended, states: The Commission shall enter into an

agreement under subsection b of this section with any State if:

(1) The Governor of that State certifies that the State has a program for the control of radiation hazards adequate to protect the public health and safety with respect to the materials within the State covered by the proposed agreement, and that the State desires to assume regulatory responsibility for such materials; and

(2) The Commission finds that the State program is in accordance with the requirements of subsection o, and in all other respects compatible with the Commission's program for the regulation of such materials, and that the State program is adequate to protect the public health and safety with respect to the materials covered by the proposed amendment.

The staff has concluded that the State of Utah meets the requirements of Section 274 of the Act. The State's statutes, regulations, personnel, licensing, inspection and administrative procedures are compatible with those of the Commission and adequate to protect the public health and safety with respect to the materials covered by the proposed agreement. Since the State is not seeking authority over uranium milling activities subsection o, is not applicable to the proposed Utah agreement.

Dated at Bethesda, Maryland, this 20th day of December 1983.

For the U.S. Nuclear Regulatory Commission.

G. Wayne Kerr,

Director, Office of State Programs.

**Appendix A—Proposed Agreement Between the United States Nuclear Regulatory Commission and the State of Utah for Discontinuance of Certain Commission Regulatory Authority and Responsibility Within the State Pursuant to Section 274 of the Atomic Energy Act of 1954, As Amended**

Whereas, The United States Nuclear Regulatory Commission (hereinafter referred to as the Commission) is authorized under Section 274 of the Atomic Energy Act of 1954, as amended (hereinafter referred to as the Act), to enter into agreements with the Governor of any State providing for discontinuance of the regulatory authority of the Commission within the State under Chapters 6, 7, and 8, and Section 161 of the Act with respect to by-product materials as defined in sections 11e, (1) and (2) of the Act, source materials, and special nuclear materials in quantities not sufficient to form a critical mass; and

Whereas, The Governor of the State of Utah is authorized under Utah Code Annotated 26-1-29 to enter into this Agreement with the Commission; and

Whereas, The Governor of the State of Utah certified on November 14, 1983 that the State of Utah (hereinafter referred to as the State) has a program for the control of radiation hazards adequate to protect the public health and safety with respect to the

materials within the State covered by this Agreement, and that the State desires to assume regulatory responsibility for such materials; and

Whereas, The Commission found on — that the program of the State for the regulation of the materials covered by this Agreement is compatible with the Commission's program for the regulation of such materials and is adequate to protect the public health and safety; and

Whereas, The State and the Commission recognize the desirability and importance of cooperation between the Commission and the State in the formulation of standards for protection against hazards of radiation and in assuring that State and Commission programs for protection against hazards of radiation will be coordinated and compatible; and

Whereas, The Commission and the State recognize the desirability of reciprocal recognition of licenses and exemptions from licensing of those materials subject to this Agreement; and

Whereas, This Agreement is entered into pursuant to the provisions of the Atomic Energy Act of 1954, as amended;

Now, therefore, It is hereby agreed between the Commission and the Governor of the State, acting in behalf of the State, as follows:

#### Article I

Subject to the exceptions provided in Articles II, IV, and V, the Commission shall discontinue, as of the effective date of this Agreement, the regulatory authority of the Commission in the State under Chapters 6, 7, and 8, and Section 161 of the Act with respect to the following materials:

A. Byproduct materials as defined in section 11e.(1) of the Act;

B. Source materials; and

C. Special nuclear materials in quantities not sufficient to form a critical mass.

#### Article II

This Agreement does not provide for discontinuance of any authority and the Commission shall retain authority and responsibility with respect to regulation of:

A. The construction and operation of any production or utilization facility;

B. The export from or import into the United States of byproduct, source, or special nuclear material, or of any production or utilization facility;

C. The disposal into the ocean or sea of byproduct, source, or special nuclear waste materials as defined in regulations or orders of the Commission;

D. The disposal of such other byproduct, source, or special nuclear material as the Commission from time to time determines by regulation or order should, because of the hazards or potential hazards thereof, not be so disposed of without a license from the Commission;

E. The land disposal of source, byproduct and special nuclear material received from other persons; and

F. The extraction or concentration of source material from source material ore and the management and disposal of the resulting byproduct material.

#### Article III

This Agreement may be amended, upon application by the State and approval by the Commission, to include the additional area(s) specified in Article II, paragraph E or F, whereby the State can exert regulatory control over the materials stated therein.

#### Article IV

Notwithstanding this Agreement, the Commission may from time to time by rule, regulation, or order, require that the manufacturer, processor, or producer of any equipment, device, commodity, or other product containing source, byproduct, or special nuclear material shall not transfer possession or control of such product except pursuant to a license or an exemption from licensing issued by the Commission.

#### Article V

This Agreement shall not affect the authority of the Commission under subsection 161 b. or i. of the Act to issue rules, regulations, or orders to protect the common defense and security, to protect restricted data or to guard against the loss or diversion of special nuclear material.

#### Article VI

The Commission will use its best efforts to cooperate with the State and other Agreement States in the formulation of standards and regulatory programs of the State and the Commission for protection against hazards of radiation and to assure that State and Commission programs for protection against hazards of radiation will be coordinated and compatible. The State will use its best efforts to cooperate with the Commission and other Agreement States in the formulation of standards and regulatory programs of the State and the Commission for protection against hazards of radiation and to assure that the State's program will continue to be compatible with the program of the Commission for the regulation of like materials. The State and the Commission will use their best efforts to keep each other informed of proposed changes in their respective rules and regulations and licensing, inspection and enforcement policies and criteria, and to obtain the comments and assistance of the other party thereon.

#### Article VII

The Commission and the State agree that it is desirable to provide reciprocal recognition of licenses for the materials listed in Article I licensed by the other party or by any Agreement State. Accordingly, the Commission and the State agree to use their best efforts to develop appropriate rules, regulations, and procedures by which such reciprocity will be accorded.

#### Article VIII

The Commission, upon its own initiative after reasonable notice and opportunity for hearing to the State, or upon request of the Governor of the State, may terminate or suspend all or part of this agreement and reassert the licensing and regulatory authority vested in it under the Act if the Commission finds that (1) such termination or

suspension is required to protect the public health and safety, or (2) the State has not complied with one or more of the requirements of section 274 of the Act. The Commission may also, pursuant to section 274j. of the Act, temporarily suspend all or part of this agreement if, in the judgment of the Commission, an emergency situation exists requiring immediate action to protect public health and safety and the State has failed to take necessary steps. The Commission shall periodically review this Agreement and actions taken by the State under this Agreement to ensure compliance with section 274 of the Act.

#### Article IX

This Agreement shall become effective on —, 1984, and shall remain in effect unless and until such time as it is terminated pursuant to Article VIII.

Done at Salt Lake City, Utah, in triplicate, this — day of —, 1984.

For the United States Nuclear Regulatory Commission.

Nunzio J. Palladino,  
Chairman.

For the State of Utah.

Scott M. Matheson,  
Governor.

#### Appendix B—Narrative Portion of Program Description

##### State of Utah Bureau of Radiation Control Radiation Regulatory Program

##### I. Foreword

The 1967 Utah Legislature passed the "Radiation Protection Act" which authorized the State Board of Health to require the registration of ionizing radiation sources and to adopt the necessary rules and regulations for controlling exposure to harmful ionizing radiation (26-1-27). The State Department of Health was designated to establish, carry out and enforce a radiation control program. (26-1-28). The governor was authorized to enter into agreements with the federal government to assume certain responsibilities with respect to sources of ionizing radiation. (26-1-29).

Upon a decision by the Utah Attorney General's office that the 1967 legislation was not sufficient to carry out these functions, the 1981 legislature passed a revised version which overcame the deficiencies by adding authority to license.

Copies of this legislation are enclosed as Appendix A. The Bureau of Radiation Control is now aggressively pursuing Agreement status.

##### II. History

Previous to 1961, radiation problems received limited attention. During this time attention was called to a proposal to use radioactive tailings from the Vitro uranium mill as fill material in the construction of an interstate highway. The Department of Health maintained its position which had been established earlier in refusing permission to move any of the material for any purpose. This position has continued as Utah sought help from federal agencies to

define the problems associated with uranium mill tailings.

In 1961, a chemist was added and assigned to work 1/4 time in radiation related matters. He received training in x-ray from the U.S. Public Health Service and attended a 10 week course in Health Physics at Oak Ridge, Tennessee. He accompanied AEC inspectors as they visited licensees in Utah and inspected x-ray facilities upon request. In 1962 the U.S. Public Health Service assigned one of their staff to survey the x-ray facilities in Utah. He spent just over a year and surveyed all the x-ray facilities in Utah.

In 1962 high levels of radioactive contamination from the Sedan Atomic test at the Nevada Test Site were found in Utah milk. The Health Department diverted the most highly contaminated milk from human use until the Iodine-131 could decay. This called attention to the need for a radiological laboratory in Utah. With the assistance of the U.S. Public Health Service a laboratory was established in 1964 with both wet chemistry and instrumental analysis. The laboratory has been continually upgraded. A lithium drifted germanium detector with computer electronics was added and, at present, the laboratory has provisional interim certification for drinking water analysis for gross alpha, gross beta, radium-226, radium-228 and tritium.

As a result of the Sedan contamination problem, a milk sampling network was established and weekly samples were analyzed for contamination until well after atmospheric testing was discontinued at the Nevada Test Site. Until 1972 medical and dental x-ray facilities were surveyed upon request and some industrial x-ray facilities were looked at.

In 1972, the Radiation and Occupational Health Section of the Division of Environmental Health was expanded by addition of three more professionals, one a full-time health physicist. Efforts were made to establish radiation control regulations but opposition was encountered and these efforts were unsuccessful. Inspections of x-ray facilities were performed using NCRP Recommendations as a standard. Letters were sent to the facilities specifying items of deficiency. The majority of the installations complied voluntarily with the recommendations. Bureau staff members have accompanied AEC (NRC) inspectors on numerous inspections of Utah licensees, contributing to the inspection report by invitation.

In 1972, Bureau staff assisted the Environmental Protection Agency in sampling for radon and radon daughters on and near the Vitro uranium mill site. A network of samplers was set up and serviced by Radiation and Occupational Health personnel. In 1973, Utah cooperated with the Bureau of Radiological Health in its Nationwide Evaluations of X-ray Trends (NEXT) to gather statistical data about x-ray exposure to the public. This study (NEXT) was continued for a number of years.

In 1975, a second professional health physicist was employed full time in radiological health. With this additional help a dental x-ray program, Dental Exposure Normalization Technique (DENT) was

carried out to reduce exposure to patients from dental x-rays. The new techniques which were selected by the dentists reflect a 49% reduction in dental x-ray exposure. Programs were conducted with practitioners of various disciplines to improve radiographic quality while reducing patient exposure. In 1978, radon daughter concentrations were measured in some Salt Lake County businesses which were more than 5 times the maximum continuous levels allowed in uranium mines. This gave additional impetus to bills being introduced into Congress by the Utah delegates which asked for federal assistance for the clean up of uranium mill tailings. These efforts and the efforts of other states culminated in the passage of Pub. L. 95-604 "The Uranium Mill Tailings Radiation Control Act of 1978".

In 1972, an E.P.A. study identified many locations throughout much of Utah where the use of uranium mill tailings as fill material was indicated. Beginning in 1978, indoor radon measurements were made by the Bureau of Radiation Control at those locations in Salt Lake County where uranium mill tailings were used near or under habitable buildings. Through the cooperation of the U.S. Department of Energy, aerial surveys were made to complete the identification of sites where tailings were used in a large part of Salt Lake County and other Utah communities. Some additional businesses were found with high radon concentrations.

In 1979, a third full time health physicist was added to the staff to work with uranium mill tailings remedial action and assist with a new contract with the Bureau of Radiological Health to make compliance surveys of new diagnostic x-ray machines.

In 1980, a fourth full time health physicist was added to the staff to provide technical support for the governor's "High Level Nuclear Waste Task Force". This task force was appointed on June 2, 1980 to oversee the U.S. DOE's field operations in Utah, make recommendations to the governor and communicate information to the people of Utah.

In 1981, a contract was signed with Mound Laboratory for the State to monitor properties near the Vitro Uranium mill. A health physics technician was added to the staff to fill the Mound contract requirements.

In July 1981, the occupational health functions were transferred to the Industrial Commission and the Bureau was renamed the Bureau of Radiation.

In January 1982, the Bureau of Radiation was divided to form the Bureau of Uranium Mill Tailings Management and the Bureau of Radiation Control. The Bureau of Radiation Control under a new director was given the task of preparing a complete radiation control program in preparation for entering an agreement with the U.S. Nuclear Regulatory Commission.

In December 1982, the Bureau of Uranium Mill Tailings Management was combined with the Bureau of Radiation Control with the new organization as indicated on the Function Chart in Appendix B.

The Utah Radiation Control Regulations were formally adopted and became effective on January 1, 1983. Since that date, the

Bureau has been licensing and inspecting users of naturally occurring and accelerator produced radioactive materials (NARM). The regulations provide for a "Radiation Technical Advisory Committee" of eight (8) members to advise, comment and provide technical assistance to the Bureau Director.

### III. Administrative Policy and Procedures

**A. Introduction and Purpose.** The following procedures are to assure uniformity, continuity and appropriate treatment in all licensing, registration and regulatory practices and to maintain radiation exposures to all persons in the State as low as is reasonably possible.

Procedures are also to assure that emergency response to radiological incidents is correlated with the appropriate government agencies and that the proper information is provided to the public.

Procedures shall also provide for feedback to the Bureau director from the staff on the status of activities in regard to regulatory actions, problem cases, inquiries and need for regulation revisions.

**B. Priority of Responsibilities.** The responsibilities for Radiation Control, after the program is established, shall be given priority in the following order:

1. Emergency response to radiological incidents.
2. Respond to request by workers for inspection.
3. Routine inspection of radiation sources.
4. Reinspection of non-compliant facility and enforcement procedures.
5. Registration or licensing of radiation sources.
6. Review plans as submitted under URC-28-032.
7. Assist licensee in developing program under URC-24-015.

**C. Emergency Response Procedures.** Emergency response to radiological incidents will take precedence over other duties and will require immediate response by one or more technical staff.

1. Names of emergency response team members will be left with the department operator during off duty hours.
2. Emergency response kits will be kept in the office ready for immediate response.
3. When an emergency situation is reported the following information will be obtained.
  - a. Name and telephone number of caller.
  - b. Alternate contact and telephone number.
  - c. Company or agency of caller.
  - d. Location of incident.
  - e. Type and amount of radioactive material.
  - f. Detailed account of the problem.
  - g. Shipper address and telephone number.
  - h. Consignee address and telephone number.
4. Who has been called in.
5. The leader of the emergency response team will have successfully completed the NRC Radiological emergency response training course.
6. All questions by the news media will be referred to the Bureau Director.

**D. Procedure for Response to Workers Request for Inspection.** 1. The request for inspection shall be in writing and outline the alleged violations.

2. The request shall be reviewed by bureau personnel and compared to past inspection reports.

3. A copy of the alleged violations will be delivered to the licensee at the time of the inspection.

4. Response to the request by workers that an inspection be performed under URC-48-070 shall be made as soon as practicable, preferably no later than 7 working days from receipt of written request.

5. Following the inspection a written report will be furnished to the complainant of any violations of the Bureau of Radiation Control Regulations.

6. The identity of the individuals requesting the inspection shall be protected as provided for in URC-48-070.

**E. Procedure for Registration of Ionizing Radiation Machines.** The following outline describes the procedures for keeping track of the registration and survey program. In all cases, the registrant should submit a completed BRC Form 10 along with the registrant's signature. Once the secretary has received this application, a registration certificate will be typed on BRC Form 11 and issued to the applicant.

**1. Registration.**

**a. On receipt of an application:**

(1) Check to assure that applicant has not previously been registered.

(2) If not registered, obtain new registration number, county-discipline-sequential.

(3) Note if the appropriate fee is enclosed. If any discrepancies are noted, registration and fee is returned for corrective actions by registrant.

**b. Initiate folder.**

(1) Place application form and a copy of the registration certificate in the folder. Add any other correspondence concerning this registration.

(2) Original copy of registration certificate is sent to the registrant for his files.

c. Registrant's name, address, registration number, inspection due date, and inspection information will be entered on to the word processor.

d. Mail the original certificate to the registrant. If a new registrant, the following will be included with this certificate:

(1) Notice to Employee, BRC Form 4.

(2) Copy of those sections of the Bureau of Radiation Control Regulations that apply.

**2. Change in Registration.**

**a. Address Change.**

Change all registration sheets and update word processor and indicate date.

**b. Equipment Change.**

Change all registration sheets and update word processor and indicate date.

**c. Deaths.**

(1) Mark all registration sheets accordingly.

(2) Mark manila folder "inactive", only if (4) is completed.

**(3) Do not re-issue number.**

(4) Locate and maintain surveillance on equipment until it is properly disposed of.

**d. Retirements.**

(1) Mark all registration sheets accordingly.

(2) Mark manila folder "inactive", if (4) is completed.

(3) Do not re-issue number.

4. Make sure machine is properly disposed of.

**3. Procedures for Handling Completed Survey Reports:**

After an x-ray unit has been registered, staff members will perform a radiation survey to determine if the registrant meets the Bureau of Radiation Control regulations. During this survey, the staff member(s) will place data on "survey reports". All reporting documents will be held in registrant's file. A letter to the registrant will be issued from the Bureau informing him if he is in compliance or explain items of non-compliance.

a. File result sheet in manila folder. The letter indicating compliance or listing items of non-compliance will be issued within 15 days after completion of inspections. A copy of this will be filed with the survey result sheet in the manila folder.

**b. Non-Compliance Survey Reports.**

The non-compliance survey reports will be filed on the word processor, 30-day action is required.

**4. Follow-up Procedure.**

a. Pull non-compliant registrants from word processor on a monthly basis for follow-up. If installation becomes "in compliance" the data on the word processor will be corrected, if non-compliance continues further action will be taken.

b. Send follow-up letters to all appropriate registrants with non-compliances, note issuance of follow-up letter on word processor.

c. If answer is not received during second 30 day period, an additional 15-day notice will be written.

d. If answer is not received during 15-day period, file will be referred to the Attorney General's office for appropriate action.

**5. Procedures When "Non-Compliance" Items are corrected.**

a. We will accept a written notice with signature that items of non-compliance have been corrected.

b. Upon receiving such information the following will be done:

(1) The compliance action notice from the responsible person will be placed in the manila folder for future inspection and a corrective action letter will be issued by the Bureau.

(2) Result sheet will be marked compliance by indicating date information was received and by what route. The information will be left in the manila folder.

**F. Procedures for Licensing Radioactive Material:** The specific material to be licensed by the State will be: (a) By-product material (as defined under 11(a) of the Atomic Energy Act of 1954 as amended), (b) Source Material, (c) Special nuclear material in quantities not sufficient to form a critical mass. The United States Nuclear Regulatory Commission Guides will be used for evaluation of all radioactive material applications.

1. All applicants must submit a completed state form (e.g., BRC-01 or BRC-02) along with the application fee. Once the application is received, a file folder will be created and a sequence number given.

2. Applications will be reviewed in sequence by assigned staff. Staff reviewing license applications will have completed the

NRC course on licensing practices and procedures.

3. Reviewing staff will determine if application is for a new license, renewal or an amended license. Renewal and amended license applications will be referred to the original file.

4. The reviewer shall determine if all requested material has been submitted and fees paid. If material is not complete or if fees have not been paid, the applicant will be notified that no processing of the application will take place until those items are rectified.

5. If the application is in order and fees paid, it will be reviewed using the following guide lines:

a. Does the application meet the requirements of the BRC regulations?

b. Is the applicant qualified by reasons of training and experience?

c. Are the facilities adequate to carry out the proposed activity? (This may include onsite inspections.)

6. If the application meets all the requirements a license will be issued using form BRC-03 and listing any special conditions or limitations which are applicable.

a. Included with the license mailed to the licensee will be a copy of "Notice to Employees" BRC Form-04 and a copy of Bureau of Radiation Control regulations that apply.

b. A copy of the license and the application will be placed in the applicants permanent file.

c. One file on the word processor will be completed for each license, including the name and address of applicant, the license number, the inspection due date, completed inspection date and remarks.

7. If the application does not meet the requirements, the applicant will be notified by letter of any deficiencies, or any additional information and changes which may be necessary.

**G. Inspection priority.**

| Priority  | Type of license or facility   | Inspection frequency |                  |
|-----------|---|----------------------|------------------|
|           |   | Initial (months)     | Routine (months) |
| I.....    | Reserved.....   |                      |                  |
| II.....   | Radiography (field), Medical-Broad, Academic Type A, Uranium-By-product.....  | 6                    | 10               |
| III.....  | Hospital x-ray, Orthopedic x-ray Clinics, Radiology x-ray Clinics, Therapeutic x-ray, Accelerators, Radiography (in-house).....                     | 6                    | 12               |
| IV.....   | Waste collection, (prepackaged waste only) Industrial, Industrial type B Broad.....   | 6                    | 15               |
| V.....    | Industrial Limited, Academic, Civil Defense, Soil Moisture and Density Gauges, Chiropractic x-ray, other medical x-ray.....                         | 6                    | 18-24            |
| VI.....   | Medical limited, Eye Applicator, Gauge Repair, Gauge Use, Chromatography, Light Sources, Leak Test Services, Calibration Sources, Dental X-Ray..... | 6                    | 12-36            |
| VII.....  | Veterinary x-ray.....   | 12                   | 48               |
| VIII..... | Teletherapy.....  | 6                    | 24               |
| IX.....   | Walk-In Type Irradiator.....  | 6                    | 12               |

\*Note.—See Definition URC-12-050(43) in Utah Radiation Control Regulations.

\*Note.—Other medical x-ray includes all diagnostic x-ray except hospitals, radiology clinics, orthopedic clinics, dental and veterinary x-ray.

**H. Enforcement Procedures.** The United States Nuclear Regulatory Commission Inspection Guides will be used to establish format for inspection procedures.

1. Following an inspection, the licensee will be notified by letter of (a) compliance including the results of the inspection, or (b) the areas of non-compliance and requesting written notification within 30-days describing:

- Corrective steps which have been taken by the licensee and the results achieved.
- Corrective steps which will be taken to prevent recurrence; and
- The date when full compliance will be achieved.

2. If response is not received in 30 days, a second letter will be sent requiring response within 15 days to avoid issuance of an order or other legal proceedings.

3. An order is a written directive to modify, suspend or revoke a license; to cease and desist from a given practice or activity, or to take such other action as may be appropriate.

a. License modification order will be issued when some change in licensee equipment, procedures, or management controls is necessary.

b. Suspension Orders will be used:

- To remove a threat to the public health.
- When licensee has not responded adequately to other enforcement action.

(3) When the licensee interferes with the conduct of an inspection; or

(4) For any reason not mentioned above for which license revocation is legally authorized.

c. Revocation Orders will be used:

- When a licensee is unable or unwilling to comply with bureau requirements;
- When a licensee has refused to correct a violation;

(3) When a licensee does not pay a fee required by the bureau.

d. Cease and desist orders are used to stop an unauthorized activity that has continued despite notification by the Bureau that such activity is unauthorized.

e. Orders are made effective immediately, without prior opportunity for hearing, whenever it is determined that the public health, interest or safety so requires, or when the order is responding to a violation involving willfulness. Otherwise, a prior opportunity for a hearing on the modification is afforded.

4. If repetitive serious violations occur, BRC will consider issuing orders in conjunction with other enforcement actions to achieve immediate corrective actions and to deter further recurrence of serious violations.

5. Related administrative actions.

a. In addition to the formal enforcement mechanisms of notice of violation and orders, BRC will also use conferences, bulletins, circulars, information notices, notices of deviation, confirmatory action letters, defined as follows:

(1) Enforcement conferences are meetings held with licensee management to discuss safety, health and compliance with regulatory requirements.

(2) Bulletins, circulars and information notices are written notices to groups of licensees identifying specific problems and calling for or recommending specific actions on their part.

(3) Notice of Deviation are written notices describing a licensee's failure to satisfy a commitment.

(4) Confirmatory action letters are letters confirming a licensee's agreement to take certain actions.

1. *Policy For Review of Plans Submitted Under URC-28-032 (Preconstruction Review of Shielding Plans).* 1. Plans should be submitted a minimum of 30 days before anticipated construction.

2. If it appears that additional shielding would be advisable, this recommendation would be made in writing to those submitting the plans within 30 days of receiving the plans for review.

J. *Policy for Staff Assistance in Developing ALARA Programs in Accordance with URC-24-015 (This Section Requires Implementation of ALARA Programs and Offers Assistance by the Bureau When Requested).* 1. ALARA programs submitted to the Bureau shall be reviewed by the Staff. If the program is deficient, recommendations will be made to upgrade the program.

2. During each inspection, the ALARA program will be reviewed with the registrant or licensee.

3. A list of successful methods will be made and given to those requesting assistance.

K. *Staff Training Policy.* 1. Update training will be conducted on a regular basis to enhance technical proficiency. The goal of in-house training will be to maintain a basic understanding of the following topics:

- Atomic structure and natural radioactivity.
- Properties of Alpha and Beta Particles, Gamma Rays, X-Ray and Neutrons.
- Radiation units and external dose determinations.
- Biological effects of radiation.
- Shielding.

f. Operation and calibrations of instruments for measurements of ionizing radiation.

g. Inspection procedures.

h. Special topics as needed.

2. The staff will be sent to national courses in all aspects of Radiation Control as federal or state funds are available.

3. Each staff member will be encouraged to devote some time to personal study and be working toward certification as a health physicist.

L. *Media Relations.* Media relations and the Bureau of Radiation Control can be divided into two general categories: the regular release of information and the information release following an incident involving radioactive material.

*Regular Information Release.* All information released to the media is to go through the Department of Health's public information officer. The policy for the Division of Environment Health has been to have the draft press release prepared by the bureau and then approved by the divisions director. This is then sent to the public information officer for release.

Telephone press inquiries are generally handled by the bureau director who then

briefs the public information officer on the interview. Requests for television interviews are relayed to the public information officer with background as to the reason for the request.

The bureau director is to keep the public information officer current on any aspects of his programs which may attract media attention. This includes briefings on *potentially significant new stories.* The bureau director will also work with the public information officer on specific issues which could or should be brought up in the press. Such briefings are important to keep the public information officer current on concerns and programs of the bureau to give him the necessary background on the bureau's activities. The public information officer will make such arrangements as feature stories, interviews, press conference or other means best suited to the material to be disseminated. The spokesman for the Bureau of Radiation Control is the bureau director or the public information officer.

It is imperative in such situations that timely, accurate and current notices to the public through the press be maintained. Special attention is to be paid to stopping rumors, correcting misinformation and presenting an accurate assessment of the situation which the public can understand. Ignorance and fear can lead to panic. The press can be of great help in preventing panic and in helping make people aware of the real dangers involved, need to evacuate, etc.

A single spokesman for the Department of Health is to be established. Unless otherwise indicated by the Executive Director, Utah Department of Health, this spokesman is the public information officer. He will work closely with the bureau director and division director in his dealings with the press. There should be no unauthorized interviews by staff or others speaking for the Department of Health. Requests for statements or interviews should be directed to the public information officer, division director or bureau director.

*The Media and "Incident" Coverage.* The public information officer for the Department of Health should be notified immediately of any incident related to radioactivity which is a threat to the public health. Depending on the nature and extent of the incident, his activities will be coordinated with the Division of Comprehensive Emergency Management.

It is advantageous to establish a central press room if the scene of the incident is not accessible. This will make it possible for regular and timely updates.

Statements made on the scene of the incident should be limited to the known facts and not conjecture or possibilities. The press should be referred to the public information officer or bureau director by staff when they are approached by the press for interviews or comments.

#### IV. Organization, Staff and Equipment

The "Utah Health Code" adopted by the 1981 Utah Legislature created a "Department of Health" from the "Division of Health" of the Department of Social Services. The code gave unto the Department of Health authority to require the registration and licensing of hazardous sources of radiation and to adopt

necessary rules for controlling radiation exposure to such sources. The code also directed the Department of Health to establish, carry out, and enforce a radiation control program pursuant to the adopted rules and any federal-state agreement (The 1981 "Utah Health Code" is contained in Appendix A with pertinent statutes).

The Department of Health is divided into four Divisions. (1) The Division of Health Planning and Facilities; (2) The Division of Environmental Health; (3) The Division of Community Health Services; and (4) The Division of Family Health Services. The Division of Environmental Health is divided into six (6) Bureaus including the Bureau of Radiation Control which includes the functions of the Bureau of Uranium Mill Tailings Management. The Bureau is only concerned with title I UMTRPA activities. A chart showing the organization of the Department of Health and a function chart of the Bureau of Radiation Control are contained in Appendix B. Since this chart was drawn, a recombination of the Bureau of Radiation Control and the Bureau of Uranium Mill Tailings Management was effected with the structure as indicated in the function chart also included in Appendix B. The

current staff includes one (1) health physicist certified by the American Board of Health Physics, two (2) health physicists one with extensive experience, and one (1) other staff member undergoing in-house training and attending NRC training courses.

Personnel working in Radioactive Materials Program:

| Name                    | Time (per-cent) | Responsibilities                      |
|-------------------------|-----------------|---------------------------------------|
| Larry F. Anderson.....  | 20              | Administrative.                       |
| Blaine Howard.....      | 100             | Licensing and Inspections.            |
| Arnold J. Pearl.....    | 100             | Licensing and Inspections.            |
| Donald G. Mitchell..... | 10              | Training in Licensing and Inspection. |
| Gerald R. Ripley.....   | 10              | Training in Licensing and Inspection. |
| New Hire.....           | 10              | Training in Licensing and Inspection. |

Resume's of the current staff are included in Appendix B. The five categories of job descriptions included in the appendix will all be necessary to allow for promotion incentives for the in-house training program. This will allow hiring of individuals with limited experience and involving them in our training program with advancement available

when training and experience requirements are reached.

Standard letters, standard forms, and license conditions have been prepared. Copies of the most recent versions of these materials have been included in Appendix C.

The Bureau has on hand sufficient equipment and instrumentation for the adequate conduct of the present Radiation Control Program. An inventory of this equipment is included in Appendix D.

The Utah Legislature has authorized appropriations to carry out the regulatory functions of the Bureau.

#### V. Emergency Response

All of the current technical staff have attended the training course in Radiological Emergency Response Operations for Radiological Emergency Response Teams of State and local governments formally sponsored by the Office of State Programs, U.S. Nuclear Regulatory Commission. The Bureau has developed a radiological comprehensive emergency management section with the Utah Highway Patrol.

BILLING CODE 6560-50-M

# Registered Federal Labor

---

Friday  
January 20, 1984

---

## Part III

## Department of Labor

Employment Standards Administration,  
Wage and Hour Division

---

Minimum Wages for Federal and  
Federally Assisted Construction; General  
Wage Determination Decisions; Notice

## DEPARTMENT OF LABOR

Employment Standards  
Administration, Wage and Hour  
DivisionMinimum Wages for Federal and  
Federally Assisted Construction;  
General Wage Determination  
Decisions

General wage determination decisions of the Secretary of Labor specify, in accordance with applicable law and on the basis of information available to the Department of Labor from its study of local wage conditions and from other sources, the basic hourly wage rates and fringe benefit payments which are determined to be prevailing for the described classes of laborers and mechanics employed on construction projects of the character and in the localities specified therein.

The determinations in these decisions of such prevailing rates and fringe benefits have been made by authority of the Secretary of Labor pursuant to the provisions of the Davis-Bacon Act of March 3, 1931, as amended (46 Stat. 1494, as amended, 40 U.S.C. 276a) and of other Federal statutes referred to in 29 CFR 1.1 (including the statutes listed at 36 FR 306 following Secretary of Labor's Order No. 24-70) containing provisions for the payment of wages which are dependent upon determination by the Secretary of Labor under the Davis-Bacon Act; and pursuant to the provisions of part 1 of subtitle A of title 29 of Code of Federal Regulations, Procedure for Predetermination of Wage Rates (37 FR 21138) and of Secretary of Labor's Orders 12-71 and 15-71 (36 FR 8755, 8756). The prevailing rates and fringe benefits determined in these decisions shall, in accordance with the provisions of the foregoing statutes, constitute the minimum wages payable on Federal and federally assisted construction projects to laborers and mechanics of the specified classes engaged on contract work of the character and in the localities described therein.

Good cause is hereby found for not utilizing notice and public procedure thereon prior to the issuance of these determinations as prescribed in 5 U.S.C. 553 and not providing for delay in effective date as prescribed in that section, because the necessity to issue construction industry wage determination frequently and in large volume causes procedures to be

impractical and contrary to the public interest.

General wage determination decisions are effective from their date of publication in the *Federal Register* without limitation as to time and are to be used in accordance with the provisions of 29 CFR Parts 1 and 5. Accordingly, the applicable decision together with any modifications issued subsequent to its publication date shall be made a part of every contract for performance of the described work within the geographic area indicated as required by an applicable Federal prevailing wage law and 29 CFR, Part 5. The wage rates contained therein shall be the minimum paid under such contract by contractors and subcontractors on the work.

Modifications and Supersedes  
Decisions to General Wage  
Determination Decisions

Modifications and supersedes decisions to general wage determination decisions are based upon information obtained concerning changes in prevailing hourly wage rates and fringe benefit payments since the decisions were issued.

The determinations of prevailing rates and fringe benefits made in the modifications and supersedes decisions have been made by authority of the Secretary of Labor pursuant to the provisions of the Davis-Bacon Act of March 3, 1931, as amended (46 Stat. 1494, as amended, 40 U.S.C. 276a) and of other Federal statutes referred to in 29 CFR 1.1 (including the statutes listed at 36 FR 306 following Secretary of Labor's Order No. 24-70) containing provisions for the payment of wages which are dependent upon determination by the Secretary of Labor under the Davis-Bacon Act; and pursuant to the provisions of part 1 of subtitle A of title 29 of Code of Federal Regulations, Procedure for Predetermination of Wage Rates (37 FR 21138) and of Secretary of Labor's orders 13-71 and 15-71 (36 FR 8755, 8756). The prevailing rates and fringe benefits determined in foregoing general wage determination decisions, as hereby modified, and/or superseded shall, in accordance with the provisions of the foregoing statutes, constitute the minimum wages payable on Federal and federally assisted construction projects to laborers and mechanics of the specified classes engaged in contract work of the character and in the localities described therein.

Modifications and supersedes decisions are effective from their date of publication in the *Federal Register* without limitation as to time and are to be used in accordance with the provisions of 29 CFR Parts 1 and 5.

Any person, organization, or governmental agency having an interest in the wages determined as prevailing is encouraged to submit wage rate information for consideration by the Department. Further information and self-explanatory forms for the purpose of submitting this data may be obtained by writing to the U.S. Department of Labor, Employment Standards Administration, Wage and Hour Division, Office of Government Contract Wage Standards, Division of Government Contract Wage Determinations, Washington, D.C. 20210. The cause for not utilizing the rulemaking procedures prescribed in 5 U.S.C. 553 has been set forth in the original General Determination Decision.

Modifications to General Wage  
Determination Decisions

The numbers of the decisions being modified and their dates of publication in the *Federal Register* are listed with each State.

# DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

## Office of the Secretary

### 24 CFR Part 841

[Docket No. N-84-1331; FR-1850]

## Prototype Cost Determinations Issued Under the United States Housing Act of 1937

**AGENCY:** Office of the Assistant Secretary for Public and Indian Housing, HUD.

**ACTION:** Notice of Prototype Cost Determinations.

**SUMMARY:** This Notice establishes prototype limits for development of public housing new construction projects under the United States Housing Act of 1937. The public housing prototype cost determinations stated in this Notice supersede the prototype cost schedules published on December 7, 1982, 47 FR 55136, and all amendments and additions to such schedules published before the date of this Notice.

**EFFECTIVE DATE:** January 20, 1984.

**FOR FURTHER INFORMATION CONTACT:** Pat Hampton, Acting Director, Technical Support Division, Office of Public Housing, Room 6248, Department of Housing and Urban Development, 451 Seventh Street, S.W., Washington, D.C. 20410, telephone (202) 755-4956. (This is not a toll-free number.)

**SUPPLEMENTARY INFORMATION:** Section 6(b) of the United States Housing Act of 1937 (42 U.S.C. 1437d) requires HUD to determine costs in different areas for construction and equipment (prototype costs) of new dwelling units suitable for occupancy by low-income families. This determination must be made at least once a year and published in the *Federal Register*. Under the law, the Department develops prototype costs for public and Indian housing projects and these prototype costs constitute a limit on development cost for the construction and equipment of new projects.

The schedules in this Notice represent the annual update of per unit prototype cost limits for development of public housing under 24 CFR Part 841 (see § 841.204).

The prototype cost determinations for the annual update are based on actual public housing and insured multifamily project data from HUD field offices and on construction cost information published by the private sector of the housing industry.

Where prototype schedules are established for special Indian prototype cost areas under 24 CFR 805.213, the

prototype cost limits apply only for development of Indian Housing (these special areas and the prototype cost limits for these areas are developed and determined by the Office of Indian Housing.) The Indian prototype schedules will be published separately in the near future. Until that publication becomes effective, Indian prototype schedules published December 7, 1982 (see 47 FR 55136) shall remain in effect.

Since Section 6(b) of the U.S. Housing Act of 1937 provides that the prototype costs shall become effective upon publication in the *Federal Register*, this Notice is effective today, the day of publication.

The following factors were considered in developing prototype costs:

1. Prototype cost comprises the cost of dwelling structures (Account No. 1460), and dwelling equipment (Account No. 1465), as described in HUD Low-Rent Housing Accounting Handbook 7510.1, Chapter 3, Section 15, and includes a pro rata share of the builders' fee and overhead, insurance, social security, sales tax, and bonds.

2. Prototype cost does not include the costs of site acquisitions, site improvement, nondwelling structures or spaces (and equipment), planning (architectural-engineering fees, permit fees, inspection, and similar costs), relocation, interest or PHA administrative costs, all of which are described in HUD Low-Rent Housing Accounting Handbook 7510.1, Chapter 3, Section 15.

3. Section 6(b) of the Act identifies factors the Secretary is to consider in determining prototype costs, including the effectiveness of existing cost limits in the area, advice of local housing producers, maximization of energy conservation for heating, lighting and other purposes, and the extra durability required for safety, security and economical maintenance of the housing. (See 42 U.S.C. 1437d.)

4. Prototype costs are ceiling amounts that may be approved for a particular project. Other considerations for a project include the following:

For public housing developed under Part 841, compliance with applicable HUD Minimum Property Standards and planning and design criteria described in HUD Public Housing Development Handbook 7417.1 Rev. Development of Indian Housing under Part 805 shall take into account compliance with applicable HUD Minimum Property Standards, but shall not be controlled by such standards (See § 805.212(a)).

Written comments will be considered, and additional amendments will be published, if the Department determines that acceptance of the comments is appropriate. Comments with respect to

cost limits for a given location should be sent to the local HUD office having jurisdiction for that location. A list of these offices follow:

### Region I

Connecticut: Dept. of HUD, One Hartford Square West, Hartford, CT 06106  
Massachusetts: Dept. of HUD, Bulfinch Bldg., 15 New Chardon Street, Boston, MA 02114

Dept. of HUD, 2922 Fuller Avenue NE., Grand Rapids, MI 49505

Minnesota: Dept. of HUD, 220 South Second Street, Minneapolis, MN 55401

Ohio: Dept. of HUD, 200 North High Street, Columbus, OH 43215

Dept. of HUD, 777 Rockwell Avenue, Cleveland, OH 44114

Wisconsin: Dept. of HUD, 744 North Fourth Street, Milwaukee, WI 53203

#### Region VI

Arkansas: Dept. of HUD, 300 West Capitol, Suite 700, Little Rock, AR 72201

Louisiana: Dept. of HUD, 1001 Howard, New Orleans, LA 70113

New Mexico: Dept. of HUD, 1403 Slocum, P.O. Box 20050, Dallas, TX 75207

Oklahoma: Dept. of HUD, 200 N.W. 5th Street, Oklahoma City, OK 73102

Texas: Dept. of HUD, 1403 Slocum, P.O. Box 20050, Dallas, TX 75207

Dept. of HUD, 800 Dolorosa, P.O. Box 9163, San Antonio, TX 78285

#### Region VII

Iowa: Dept. of HUD, 210 Walnut Street, Des Moines, IA 50309

Louisiana: Dept. of HUD, 1103 Grand Ave., Kansas City, MO 64106

Kansas: As above

Missouri: As above

Dept. of HUD, 210 North Tucker Blvd., St. Louis, MO 63101

Nebraska: Dept. of HUD, 7100 West Center Road, Omaha, NE 68106

#### Region VIII

Colorado: Dept. of HUD, 1405 Curtis Street, Denver, CO 80202

Montana: As above

North Dakota: As above

South Dakota: As above

Utah: As above

Wyoming: As above

#### Region IX

Arizona: Dept. of HUD, One Embarcadero Center, Suite 1600, San Francisco, CA 94111

California: As above

Dept. of HUD, 2500 Wilshire

Boulevard, Los Angeles, CA 90057

Dept. of HUD, 545 Downtown Plaza, P.O. Box 1978, Suite 250,

Sacramento, CA 95809

Guam: Dept. of HUD, One Embarcadero Center, Suite 1600, San Francisco, CA 94111

Hawaii: Dept. of HUD, 300 Ala Moana Boulevard, Suite 3318, Honolulu, HI 96850

Nevada: Dept. of HUD, One Embarcadero Center, Suite 1600, San Francisco, CA 94111

#### Region X

Alaska: Dept. of HUD, 710 C Street, Module G, Anchorage, AK 99501

Oregon: Dept. of HUD, 520 SW Sixth Avenue, Portland, OR 97204

Washington: Dept. of HUD, 403 Arcade Plaza Building, 1321 Second Ave., Seattle, WA 98101

A Finding of No Significant Impact with respect to the environment required by the National Environmental Policy Act (42 U.S.C. 4321-4347) is unnecessary since statutorily required prototype costs are categorically excluded under 24 CFR 50.20(1).

The Catalog of Federal Domestic Assistance program numbers are: 14.146, Low Income Housing-Assistance Program (public housing), and 14.147, Low-Income Housing-Homeownership for Low-Income Families (Turnkey III, Mutual Help for Indians).

Accordingly, the prototype per unit cost schedules for all prototype cost areas, issued under 24 CFR Part 841, Prototype Cost Limits for Low-Income Public Housing, are hereby established as shown on the tables set forth below entitled "Prototype Per Unit Cost Schedule—Regions I through X."

(Sec. 7(d), Department of HUD Act, 42 U.S.C. 3535(d); Sec. 6(b), U.S. Housing Act of 1937, 42 U.S.C. 1437d(b))

Dated: January 9, 1984.

Warren T. Lindquist,

Assistant Secretary for Public and Indian Housing.

#### 40 CFR Part 60

Standards of Performance for New  
Stationary Sources; Equipment Leaks of  
VOC and SO<sub>2</sub> Emissions From Onshore  
Natural Gas Processing Plants; Proposed  
Rules

# ENVIRONMENTAL PROTECTION AGENCY

## 40 CFR Part 60

[AD-FRL 2307-2]

### Standards of Performance for New Stationary Sources; Onshore Natural Gas Processing Plants in the Natural Gas Production Industry; Equipment Leaks of VOC

**AGENCY:** Environmental Protection Agency (EPA).

**ACTION:** Proposed rule and notice of public hearing.

**SUMMARY:** The proposed standards would limit emissions of volatile organic compounds (VOC) from specific equipment leaking VOC containing gases or liquids in the natural gas production industry. The proposed standards would require a leak detection and repair program to reduce VOC emissions from pumps, valves, and pressure relief devices; and would specify the use of certain equipment to reduce VOC emission from compressors and open-ended valves or liner. Only equipment located at onshore natural gas processing plants would be covered by the proposed standards. Pieces of equipment that are remotely located (i.e., not located at an onshore natural gas processing plant) would not be covered by the proposed standards.

The proposed standards implement Section 111 of the Clean Air Act and are based on the Administrator's decision that the crude oil and natural gas production industry causes, or contributes significantly to air pollution that may reasonably be anticipated to endanger public health or welfare. As required by Section 111 of the Clean Air Act, the proposed standards are intended to require new, modified, and reconstructed sources in the natural gas production industry to use the best demonstrated system of continuous emission reduction, considering costs, nonair quality health and environmental impacts, and energy requirements.

A public hearing will be held, if requested, to provide interested persons an opportunity for oral presentation of data, views, or arguments concerning the proposed standards.

**DATES:** *Comments:* Comments must be received on or before April 6, 1984.

*Public Hearing.* If anyone contacts EPA requesting to speak at a public hearing by February 15, 1984, a public hearing will be held on March 7, 1984, beginning at 9:00 a.m. Persons interested in attending the hearing should call Mrs.

Carol Eddinger at (919) 541-5578 to verify that a hearing will occur.

*Request to Speak at Hearing.* Persons wishing to present oral testimony should contact EPA by February 15, 1984.

**ADDRESSES:** *Comments.* Comments should be submitted (in duplicate, if possible) to: Central Docket Section (LE-131), Attention: Docket No. A-80-20-B, U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460.

*Public Hearing.* If anyone contacts EPA requesting to speak at a public hearing by February 15, 1984, the public hearing will be held at EPA Auditorium, corner of Highway 544 and Alexander Drive, RTP, NC. Persons interested in attending the hearing should call Mrs. Carol Eddinger at (919) 541-5578 to verify that a hearing will occur. Persons wishing to present oral testimony should notify Mrs. Carol Eddinger, Standards Development Branch (MD-13), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number (919) 541-5578.

*Background Information Document.* The background information document (BID) for the proposed standards is contained in the docket and may be obtained from the U.S. EPA Library (MD-35), Research Triangle Park, North Carolina 27711, telephone number (919) 541-2777. Please refer to "Equipment Leaks of VOC in the Natural Gas Production Industry—Background Information for Proposed Standards" (EPA-450/3-82-024a).

*Docket.* Docket No. A-80-20-B, containing supporting information used in developing the proposed standard, is available for public inspection and copying between 8:00 a.m. and 4:00 p.m., Monday through Friday, at EPA's Central Docket Section, West Tower Lobby, Gallery 1, Waterside Mall, 401 M Street, S.W., Washington, D.C. 20460. A reasonable fee may be charged for copying.

**FOR FURTHER INFORMATION CONTACT:** Mr. Gilbert Wood, Emission Standards and Engineering Division (MD-13), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, telephone number (919) 541-5578.

#### SUPPLEMENTARY INFORMATION:

##### Summary of Proposed Standards

The proposed standards of performance would cover equipment leaks of VOC from certain affected facilities within onshore natural gas processing plants (gas plants) in the natural gas production industry. The affected facilities would consist of each new, modified, and reconstructed compressor and each new, modified,

and reconstructed process unit. The equipment within a process unit covered by the proposed standards would include pumps, valves, pressure relief devices, open-ended valves and lines, and flanges and connectors. Only compressors and equipment containing or contacting a fluid containing more than 1.0 weight percent VOC (described as "in VOC service") would be regulated by the proposed standards.

The proposed standards would require: (1) a leak detection and repair program for pressure relief devices in gas/vapor service, for valves in gas/vapor service and in light liquid service, and for pumps in light liquid service; and (2) certain equipment for compressors and open-ended valves or lines. Flanges and other connectors, pressure relief devices in liquid service, and pumps and valves in heavy liquid service would be excluded from the routine monitoring requirements but would be subject to the same repair requirements for pressure relief devices in gas/vapor service and pumps and valves in light liquid service. The proposed standards would allow the use of alternative equipment for valves, pumps, and compressors, alternative standards for valves, and a procedure for determining the equivalency of other alternative control measures. "In gas/vapor service" means that the equipment contains organic fluids in the gaseous or vapor state. "In light liquid service" means that the equipment contains VOC liquids which would have more than 10 percent of the liquids evaporated at a boiling point of 150°C, as determined by ASTM Method D-86.

A gas plant that does not fractionate natural gas liquids and that also processes 283,000 standard cubic meters per day (scmd) [10 million standard cubic feet per day (scfd)] or less of field gas would be exempt from the routine monitoring requirements for pressure relief devices, valves, and pumps.

Reciprocating compressors in wet gas service that are located at an onshore natural gas plant that does not have a control device present at the plant site are exempt from the compressor control requirements.

##### Summary of Environmental, Energy, and Economic Impacts

The proposed standards of performance would reduce equipment leaks of VOC from newly constructed, modified, and reconstructed compressors and newly constructed, modified, and reconstructed process units by about 78 percent from the emission levels that would result with control means currently practiced by the

industry. In 1987, the proposed standards would reduce uncontrolled equipment leaks of VOC from newly constructed, modified, and reconstructed facilities by approximately 18,800 megagrams (Mg), a reduction of emissions from 24,200 megagrams of VOC per year (Mg/yr) to 5,400 Mg/yr.

The proposed standards of performance would not increase the energy usage within gas plants. In general, the controls required by the proposed standards do not require energy. Furthermore, the effect of the proposed standards would be to increase efficiency of raw material usage, so that a net positive energy impact would result. The proposed standards would also cause a positive impact on water quality by containment of potential liquid leaks. Implementation of the proposed standards would result in no adverse solid waste impact.

The proposed standards would require a cumulative capital investment of \$7.8 million for 180 newly constructed gas plants and up to \$2.3 million for 40 modified and reconstructed gas plants through 1987. The industry-wide net annual cost (after accounting for recovery credits) for newly constructed, modified, and reconstructed production facilities is estimated to be approximately \$2.5 million in 1987. Average cost effectiveness would be about \$130 per megagram of VOC reduction. These costs represent a small impact on the industry and are not expected to deter construction of gas processing plants. No adverse economic impacts are anticipated, and the consumer price of natural gas is not expected to increase more than 0.1 percent.

#### Rationale

##### *Selection of Sources and Pollutants*

The EPA Priority List (40 CFR 60.16, amended at 47 FR 951, January 8, 1982) includes, in order of priority for standards development, various major source categories that the Administrator has determined contribute significantly to air pollution that may reasonably be anticipated to endanger public health or welfare. The order of the listed categories is based on consideration of the three factors specified in Section 111(f) of the Clean Air Act: (1) the quantity of air pollutant emissions that each category will be designed to emit, (2) the extent to which each pollutant may reasonably be anticipated to endanger public health or welfare, and (3) the mobility and competitive nature of each category. The Priority List identifies the source categories for

which EPA must promulgate standards of performance. The category "Crude Oil and Natural Gas Production" ranks 29th on the list of 59 source categories.

The crude oil and natural gas production industry encompasses the operations of exploring for crude oil and natural gas products, drilling for these products, removing them from beneath the earth's surface, and processing these products from oil and gas fields for distribution to petroleum refineries and gas pipelines. The crude oil and natural gas production industry is a source of volatile organic compounds (VOC), sulfur dioxide (SO<sub>2</sub>), hydrogen sulfide (H<sub>2</sub>S), carbon disulfide (CS<sub>2</sub>), carbonyl sulfide (COS), and nitrogen oxides (NO<sub>x</sub>) emissions. All of these pollutants, except VOC, are considered in standards being developed separately. Thus, the standards proposed with this preamble would apply only to VOC emitted by this industry.

There are several VOC emission points within this industry. These emission points can be divided into three main categories: process, storage, and equipment leaks. Process emission sources include well systems, field oil and gas separators, wash tanks, settling tanks, and other sources. These process sources remove the crude oil and natural gas from beneath the earth and separate gas and water from the crude oil. Best demonstrated control technology has not been identified for process emission points; therefore, these sources have not been considered in developing the proposed standards.

Storage emission sources include field storage tanks, condensate tanks, and cleaned oil tanks. These were addressed during the development of standards of performance for storage of petroleum liquids in Subpart K of 40 CFR 60.

Equipment leaks of VOC can occur from pumps, valves, compressors, open-ended lines or valves, and pressure relief devices used in onshore crude oil and natural gas production. These leaks usually occur due to design or failure of the equipment. Equipment used in crude oil and natural gas production (not to be confused with natural gas processing) are widely dispersed over large areas. The analysis presented in the BID for the principal control technique (leak detection and repair work practices) for equipment leaks of VOC is not appropriate for widely dispersed equipment. The costs and emission reduction numbers for such an analysis are unknown at this time. Thus, the proposed standards do not apply to equipment associated with crude oil and natural gas production. The proposed standards apply only to equipment

located at onshore natural gas processing plants.

Based on recent growth projections for onshore natural gas processing plants, about 180 newly constructed facilities and as many as 40 modified or reconstructed facilities could become covered by the proposed standards during the period from 1983 to 1987. If the equipment covered by the proposed standards in these 220 gas processing plants are controlled only by existing maintenance procedures, an estimated 24,200 megagrams of VOC per year would result from these facilities in 1987. These emissions of VOC could be reduced substantially by readily available controls at reasonable costs.

Standards of performance have other benefits in addition to achieving emissions reductions. Standards of performance establish a degree of national uniformity to air pollution standards and, therefore, preclude situations in which some States may attract new industries as a result of having relaxed standards relative to other States. Further, standards of performance provide documentation that reduces uncertainty in case-by-case determinations of best available control technology (BACT) for facilities located in attainment areas and lowest achievable emission rates (LAER) for facilities located in nonattainment areas. This documentation includes identification and comprehensive analyses of alternative emission control technologies, development of associated costs, assessment of economic impacts on the industry and consumers, evaluation and verification of applicable emission test methods, and identification of specific emission limits achievable with alternate technologies.

The rulemaking process that establishes standards of performance assures adequate technical review and promotes participation of representatives of the industry being considered for regulation, government, and the public affected by the industry's emissions. The resultant standards represent a balance in which government resources are applied in a well-publicized national forum to reach a decision on a pollution emission level that allows for a dynamic economy and a healthful environment.

##### *Selection of Affected Facilities*

The choice of the affected facility for the proposed standards is based on EPA's interpretation of Section 111 of the Clean Air Act and on the judicial construction of its meaning [ASARCO, Inc., v. EPA, 578 F. 2d 319 (D.C. Cir. 1978)]. Under Section 111, standards of

performance for new stationary sources must apply to "new sources;" "source" is defined as "any building, structure, facility, or installation which emits or may emit any air pollutant" [Section 111(a)(3)]. Most industrial plants, however, may consist of numerous facilities—equipment or groups of equipment—that emit air pollutants and that, consequently, may be viewed as "sources." EPA uses the term "affected facility" to designate the equipment or groups of equipment, within a particular kind of plant, chosen as the "source" affected by given standards.

In choosing the affected facility, EPA must decide which equipment, or groups of equipment, is the appropriate unit for separate standards of performance in the particular industrial context involved. EPA must do this by examining the situation in light of the terms and purpose of Section 111 of the Clean Air Act. One major consideration in determining the definition of source is that the use of a narrower designation results in bringing replacement equipment under standards of performance sooner. If, for example, an entire plant is designated as the affected facility, no part of the plant would be covered by the standards unless the plant as a whole is "modified" (see 40 CFR 60.14) or "reconstructed" (see 40 CFR 60.15). The plant as a whole could be considered modified only if the replacement resulted in an increase in the aggregate emissions from the entire plant. The plant as a whole could be considered reconstructed only if the cost of the replacement exceeded 50 percent of the cost of an entire new plant. If, on the other hand, each piece of equipment is designated as an affected facility, then as each piece is replaced, the replacement piece will be a new source subject to the standards, regardless of the cost of the replacement or whether the replacement caused emissions from the plant as a whole to increase. Since the purpose of Section 111 is to minimize emissions by application of the best demonstrated system of emission reduction at all new and modified source (considering cost, nonair quality health and environmental impacts, and energy requirement), there is a presumption that a narrower designation of the affected facility is proper. This ensures that new emission sources within plants will be brought under the coverage of the standards as they are installed. This presumption can be overcome, however, if EPA concludes either that: (a) a broader designation of the affected facility would result in greater emission reduction; or (b) consideration of the other relevant

statutory factors (technical feasibility, costs, nonair quality health and environmental impacts, and energy requirements) leads to the conclusion that a broader designation is appropriate.

Affected facilities for standards that would cover equipment leaks of VOC could be defined as individual pieces of equipment, as groups of equipment that are operated in conjunction with each other (process units), or as groups of process units at one location (plant sites).

The alternative of defining the affected facility as separate pieces of equipment, the most narrow designation, was reviewed first. Due to the large number of equipment in a typical process unit, if EPA selected separate pieces of equipment as the basis for defining affected facilities, situations could arise in which replaced equipment in an existing process unit would be subject to the standards, while adjacent equipment would not be subject to the standards. With such a mixture of new and existing equipment, the effort to keep track of equipment covered by the standards and equipment not covered by the standards could be too costly. In addition, implementing a leak detection and repair program, the principal control technique considered for the proposed standards, for a very small proportion of the equipment within a process unit would be costly.

Therefore, EPA considered groups of equipment (with the exception of compressors, discussed below) within each process unit for the designation as an affected facility. This alternative obviates the need for, and the costs of, distinguishing between equipment covered by the standards and equipment not covered. Furthermore, in this case the designation of the affected facility as a process unit is expected to result in emission reductions comparable to the reductions achieved if the affected facility were designated as separate pieces of equipment. Based on these considerations, EPA selected the group of equipment within a process unit as the affected facility for equipment other than compressors.

Compressors, unlike the other equipment, can be easily identified because they are located together and are physically separate from the process unit. An owner or operator, at reasonable costs, could easily keep track of compressors covered by the standards and compressors not covered by the standards, and there are no other reasons for a broader designation of the affected facility. In addition, for existing compressors covered through the

reconstruction provisions of 40 CFR 60.15, the reconstruction determination includes a consideration as to whether it is technically or economically feasible for an existing compressor to meet the standards. This could be used to determine which of the few existing compressors might not be designed to allow reasonable retrofitting of the control technique described in Chapter 4 of the BID. If compressors were included among other equipment in defining affected facilities, then an existing compressor could become subject to the standards under the modification provisions, and an independent review could not be used to determine if an existing compressor was not designed to allow reasonable retrofitting of the control techniques. Based on these considerations, EPA selected the individual piece of equipment (i.e., each compressor) as the affected facility for compressors.

In summary, the proposed standards would apply to two types of affected facilities. Each gas plant compressor in VOC service is one type of affected facility. The other type of affected facility comprises all equipment in VOC service, other than compressors, within a process unit. A process unit is defined as equipment assembled for the separation of natural gas liquids from field gas, fractionation of the liquids into natural gas products, or other operation associated with the processing of natural gas products.

More specifically, a process unit has discrete boundaries that consist of the points where process fluid enters from the preceding natural gas processing activity and where the treated process fluid is discharged to storage or for further processing. For example, a separation train is a process unit because a field gas stream enters the separation train, and separate product gas and natural gas liquids are discharged from the train. If further separation of natural gas liquids is performed by fractionation, the fractionation train comprises an additional process unit. Thus, the process unit is used as the basis for defining an affected facility, but the applicability of the proposed standards is limited to specific equipment in VOC service.

The proposed standards would exempt routine changes and additions made for process improvements from the modification provisions of Section 60.14 of the General Provisions of 40 CFR Part 60 if they are made without incurring a "capital expenditure" as defined in the General Provisions. Examples of such changes include those

made for increasing the ease of maintenance, improving plant safety, and correcting minor design flaws.

These standards would apply only to equipment with process stream VOC concentrations of 1.0 weight percent or more. VOC means any organic compound that participates in atmospheric photochemical reactions. It is assumed that an organic compound participates in atmospheric photochemical reactions unless the Administrator determines that it does not. The Administrator has determined that the following organic compounds have negligible photochemical reactivity: methane; ethane; 1,1,1-trichloroethane; methylene chloride; trichlorofluoromethane; dichlorodifluoromethane; trifluoromethane; trichlorotrifluoroethane; dichlorotetrafluoroethane; and chloropentafluoroethane. The 1.0 percent cutoff is intended to exempt equipment in product natural gas service. Product natural gas has much less than 1.0 weight percent VOC; and there is little emission reduction potential associated with controlling equipment in product natural gas service. A relatively large percentage of the emissions from natural gas plants is from equipment with process streams with relatively low percentages of VOC (but greater than 1.0 weight percent). The costs of controlling equipment with VOC concentrations greater than 1.0 weight percent are reasonable, with one exception, and, therefore, they are covered by the proposed standards. The exception is reciprocating compressors in wet gas service that are located at a natural gas plant that does not have a control device at the plant site. As discussed in the *Selection of the Basis for the Proposed Standards* section of this preamble, these compressors are not subject to the compressor control requirements.

Equipment covered by standards of performance for facilities within the synthetic organic chemical manufacturing industry and within petroleum refinery process units are excluded from these proposed standards. Equipment covered by national emission standards for benzene are also excluded.

#### Control Techniques and Control Costs for Equipment Leaks of VOC

There are basically two types of control techniques available for equipment leaks of VOC: (1) leak detection and repair programs; and (2) equipments, design, and operational requirements. Leak detection and repair programs reduce equipment leaks of

VOC by establishing a procedure which includes monitoring to detect VOC leaks from specific equipment and steps to repair leaking equipment. Both types of control techniques apply to pressure relief devices, valves, and pumps. Equipment, design, and operational requirements were considered for compressors, open-ended valves or lines, and sampling connection systems. The control techniques considered for each type of equipment are summarized below and are described more fully in Chapter 4 of the BID. In addition, costs and VOC emission reductions associated with each control technique are presented below.

**Pressure relief devices.** Equipment leaks of VOC from pressure relief devices result from leakage of process materials through the pressure relief device valve seat. VOC emissions can be controlled by a leak detection and repair program or by installation of a

rupture disk between the process stream and pressure relief device.

The annual costs and VOC emission reductions achieved for monthly and quarterly leak detection and repair programs and for use of control equipment (rupture disks) were determined for pressure relief devices. A quarterly leak detection and repair program results in a net annual credit of \$610, reducing VOC emissions by approximately 950 kilograms per year (kg/yr). The cost of a monthly leak detection and repair program is completely offset by the recovery credits, and VOC emissions would be reduced by about 1 megagram per year (Mg/yr). Installation of rupture disks would control an additional 500 kg/yr but at the relatively high cost of \$6,700/Mg. The control costs per megagram of VOC reduced and the emission reductions achieved are presented in Table 1.

TABLE 1.—CONTROL COSTS PER MEGAGRAM OF VOC'S REDUCED \*

| Fugitive emission source    | Control technique *                              | Emission reduction, <sup>c</sup> Mg/yr | Average, <sup>a</sup> \$/Mg | Incremental, <sup>a</sup> \$/Mg |
|-----------------------------|--|--|-----------------------------|---------------------------------|
| Pressure relief devices     | Quarterly leak detection and repair <sup>a</sup> | 0.95                                   | ( <sup>b</sup> )            | ( <sup>b</sup> )                |
|                             | Monthly leak detection and repair                | 1.0                                    | 0                           | 5,800                           |
|                             | Rupture disks                                    | 1.5                                    | 6,800                       | 22,000                          |
| Compressors                 | Closed vent and seal system <sup>a</sup>         | <sup>b</sup> 14                        | 460                         | 460                             |
| Open-ended valves and lines | Caps on open ends <sup>a</sup>                   | 19                                     | ( <sup>b</sup> )            | ( <sup>b</sup> )                |
| Sampling connection systems | Closed purge sampling                            | 10.22                                  | 17,000                      | 17,000                          |
| Valves                      | Quarterly leak detection and repair              | 40                                     | ( <sup>b</sup> )            | ( <sup>b</sup> )                |
|                             | Monthly leak detection and repair <sup>a</sup>   | 43                                     | 0                           | 1,400                           |
|                             | Quarterly leak detection and repair              | 2.0                                    | 590                         | 590                             |
| Pumps                       | Monthly leak detection and repair <sup>a</sup>   | 2.3                                    | 610                         | 800                             |
|                             | Dual mechanical seal systems                     | 2.6                                    | 4,900                       | 31,000                          |

\* Costs and emission reductions are based on Model Plant B as presented in the BID, Appendix H.

<sup>b</sup> Further discussion of control techniques used can be found in Chapters 4 and 6 of the BID.

<sup>c</sup> Emission reductions are for Model Plant B. Refer to BID Table 7-2.

<sup>a</sup> Average dollars per megagram (cost effectiveness) = net annual cost per component ÷ annual VOC emission reduction per component.

<sup>b</sup> Incremental dollars per megagram = (net annual cost of the control technique - net annual cost of the next less restrictive control technique) ÷ (annual emission reduction of control technique - annual emission reduction of the next less restrictive control technique).

<sup>c</sup> Cost savings occur.

<sup>d</sup> Control techniques selected as the basis for the proposed standards.

<sup>e</sup> Emission reduction for compressors is from BID Appendix H, Table 3.

<sup>f</sup> Costs and emission reduction for closed purge sampling represent both inlet gas sampling and product liquids sampling.

<sup>g</sup> Monthly/quarterly leak detection and repair is allowed under the proposed standards and the incremental cost effectiveness of monthly/quarterly from quarterly leak detection and repair is less than 300 \$/Mg.

**Compressors.** Many types of seals and packings are used to limit leakage of process gases around compressor drive shafts. VOC can be emitted as a result of seal design, seal deterioration, or imperfections. VOC also can be emitted from barrier fluid degassing vents that are used on some types of mechanical seals on centrifugal compressors. Reciprocating compressors are supplied with vented seals and enclosed and vented distance pieces. Emissions from these vents can be collected and routed to either a process heater, the compressor intake, or a flare. The distance piece enclosures would be slightly pressurized with a barrier fluid (such as product gas) to prevent an explosive atmosphere in the enclosure.

The annual costs and emission reductions were estimated for the use of a closed vent system for reciprocating compressor seals and for the use of mechanical seals and barrier fluid systems for centrifugal compressor seals. The control cost per megagram of VOC reduced would be \$460. These numbers are presented in Table 1.

**Open-Ended Valves or Lines and Sampling Connection Systems.** Equipment leaks of VOC from open-ended valves or lines result from leakage of process fluids through the valve seat. These emissions can be controlled by the installation of a cap or a second valve. A net annual credit of \$1,900 would result from installation of caps on open-ended lines or valves. This

would result in an emission reduction of approximately 19 megagrams of VOC per year.

Open-ended valves or lines can be used for sampling process fluids, which may result in equipment leaks of VOC. These emissions can be reduced through the use of closed purge sampling systems. Closed purge sampling would result in an average annual cost of \$7,000 per megagram of VOC and would reduce VOC emissions by 0.22 megagrams per year. The control costs per megagram of VOC reduced and the emission reductions achieved are presented in Table 1.

**Valves.** Equipment leaks of VOC result when valve packings or O-rings that are used to limit leakage of process fluids around valve stems deteriorate. VOC emissions from valves can be reduced through leak detection and repair programs.

The annual costs per megagram of VOC emissions reduced and emission reductions achieved were determined for leak detection and repair programs. These costs and emission reductions are presented in Table 1. Quarterly monitoring for leaks from valves results in net annual savings of about \$4,000, and the cost of monthly monitoring is completely offset by the recovery credits. Quarterly monitoring would reduce VOC emissions by 40 megagrams per year, and monthly monitoring would reduce VOC emissions by 43 megagrams per year. The incremental cost per megagram of monthly monitoring compared to quarterly monitoring is \$1,400 per year.

**Pumps.** Equipment leaks of VOC result from leakage of process fluids around pump drive shafts and through deteriorated seal packings or worn mechanical seal faces. VOC can also be emitted from the barrier fluid degassing vents used on some types of dual mechanical seal systems. VOC emissions from pump seals can be reduced through leak detection and repair programs or through the use of dual mechanical seals with controlled degassing vents.

The control costs incurred for each megagram of VOC emissions reduced and emission reductions achieved were determined for leak detection and repair programs and the use of dual mechanical seals with controlled degassing vents. These costs and emission reductions are presented in Table 1. Quarterly monitoring and monthly monitoring result in costs of \$590 and \$610 per megagram of VOC controlled and reduce annual VOC emissions by 2.0 and 2.3 megagrams, respectively. Dual mechanical seals would result in a cost of \$4,900 per

megagram of VOC and would reduce annual VOC emissions by 2.6 megagrams. The incremental cost per megagram of monthly monitoring is \$800 per megagram of VOC (in comparison with quarterly monitoring), and the incremental cost per megagram of dual mechanical seals is \$31,000 per megagram of VOC (in comparison with monthly monitoring).

#### *Selection of the Basis for the Proposed Standards*

Section 111 of the Clean Air Act, as amended, requires that standards of performance be based on the best system of continuous emission reduction that has been adequately demonstrated, considering costs, nonair quality health and environmental impact, and energy requirements (best demonstrated technology). As a first step toward determining which control techniques should be selected as the basis for the proposed standards, EPA analyzed the annual cost of controlling VOC emissions and the resultant VOC reduction for each alternative control technique. EPA also considered the nonair environmental, energy, and economic impacts associated with selecting alternative control techniques as the basis for the proposed standards.

The control costs per megagram of VOC reduced are presented in Table 1. These costs do not represent the actual amounts of money spent at any particular plant site. The cost of VOC emission reduction systems will vary according to the products being produced, production equipment, plant layout, geographic location, and company preferences and policies. However, these costs are considered typical of control techniques for equipment leaking VOC within natural gas plants and can be used in making decisions about the level of control to be required.

The analysis presented in Table 1 shows that the incremental control costs per megagram of VOC reduced were \$31,000 for dual mechanical seals with controlled degassing vents compared to a leak detection and repair program with monthly monitoring. For pressure relief devices, the incremental costs per megagram were \$22,000 for rupture disks compared to a leak detection and repair program with monthly monitoring and \$5,800 for monthly monitoring compared to quarterly monitoring. The cost per megagram of VOC reduced was \$7,000 for closed purge sampling systems. These costs were judged to be unreasonably high, and, therefore, these specific control options were given no further consideration.

EPA next examined the costs and emission reductions associated with a leak detection and repair program with monthly monitoring for valves and pumps, quarterly monitoring for pressure relief devices, and the use of equipment on open-ended valves or lines, and compressors. Incremental costs per megagram of VOC reduced for these control technologies range from a credit to a cost of about \$1,400 for the typical size plant. As discussed later in this preamble, the monthly leak detection and repair requirement for valves has provisions that allow monthly/quarterly monitoring. Allowing monthly/quarterly monitoring reduces the incremental costs per megagram of VOC to a maximum of about \$800. These costs are judged to be reasonable for a typical size plant, considering the potential emission reduction to be achieved.

EPA recognizes, however, that there are some relatively small plants that operate without technically trained personnel being present because of the type of process that is performed there. While fractionating plants require the presence of technically trained personnel, small nonfractionating plants often operate unmanned or without personnel having the technical ability necessary to carry out responsibly a leak detection and repair program. In these cases, central office personnel or an outside consultant would be required to conduct leak detection and repair. The additional costs that would be incurred in such cases were examined and considered in light of the emission reduction that would be achieved (Appendix F of the BID). The costs were judged to change from reasonable to unreasonable at plants having capacities between 142,000 and 283,000 scmd (5 and 10 million scfd). Therefore, EPA decided to exempt any nonfractionating plant whose capacity is 283,000 scmd (10 million scfd) or less of field gas from the routine monitoring requirements for valves, pumps, and pressure relief devices. However, all fractionating plants, regardless of capacity, would be required to implement the routine monitoring requirements.

The costs and the cost effectiveness numbers stated in Table 1 are based on an average size plant (2.55 million scmd, or 90 million scfd) with 50 percent reciprocating compressors and 50 percent centrifugal compressors. One industry representative stated that some small plants do not have a control device and that the additional costs associated with the installation and operation of a control device would

make the reciprocating compressor control cost effectiveness unreasonable for such small facilities. The costs, including the additional costs of installing and operating a control device (a flare), were analyzed for various compressor types (reciprocating and centrifugal) in different types of VOC service (wet gas and natural gas liquids). The costs and cost effectiveness were reasonable for all combinations of compressor type and type VOC service except the reciprocating compressor in wet gas service (less than 50 weight percent VOC). The cost effectiveness for this combination was judged to be unreasonable. Therefore, the Administrator decided to exempt from the compressor control requirements reciprocating compressors in wet gas service that are located at a gas plant that does not have a control device present at the plant site.

To ensure that the analyses leading to the small plant-size exemption and to the reciprocating wet gas compressor exemption adequately considered all relevant factors, the Agency requests comments from interested parties about the recommended exemptions.

Natural gas plants are relatively large emitters of VOC, with equipment leaks comprising a significant VOC emitting segment in natural gas plants. The control techniques, for which the incremental costs per megagram emission reduction were judged to be reasonable, would result in a nationwide reduction of at least 18,800 Mg of VOC in the fifth year after proposal. It is reasonable to believe that a reduction of this size in VOC emissions from the gas production industry would be of significant benefit to the environment. After considering the results of the analysis of the control costs per megagram reduced by these control techniques, EPA tentatively selected them as the basis for the proposed standards.

Next, economic, energy, and nonair quality environmental impacts were examined to determine if they would alter the selection of the basis for the proposed standards. The economic impact analysis shows that the control techniques, for which it was decided that the costs per megagram of VOC reduced are reasonable, would result in no adverse economic impacts on the affected industry and would result in an increase in the consumer price of natural gas of no more than 0.1 percent. EPA also examined the nonair quality environmental and energy impacts of the control techniques considered for each source. Analyses of these impacts

are presented in Chapter 7 of the BID. Reduction in VOC leakage, resulting from any of the control options considered, would reduce the waste load on wastewater treatment systems, thereby having a positive impact on water quality. Solid waste impacts due to any of the control options would be minimal. Each control option would result in a net positive energy impact due to conservation of VOC which has an energy value. Since there were no adverse nonair quality environmental or energy impacts, consideration of these impacts did not affect the decision on the basis of the proposed standards.

In summary, the most effective control techniques which were considered by EPA to have reasonable incremental costs per megagram of VOC emissions reduced were selected as the basis for the proposed standards. These control techniques include a monthly leak detection and repair program for valves and pumps and a quarterly leak detection and repair program for pressure relief devices at all onshore natural gas plants except those that both do not fractionate natural gas liquids and that have a capacity of 283,000 scmd (10 million scfd) or less. Control equipment was selected as the basis for the proposed standards for open-end valves or lines and for compressors. Less restrictive control techniques were not considered further because they achieved less emission reduction; and there were no cost, economic, energy, or nonair quality environmental impacts which necessitated further examination of these control techniques.

#### *Selection of Format for the Proposed Standards*

Several formats could be used to implement the control requirements selected as the basis for the proposed standards. Section 111 of the Clean Air Act requires that a standard of performance be prescribed unless, in the judgment of the Administrator, it is not feasible to prescribe or enforce such a standard. Section 111(h) defines two conditions under which it is not feasible to prescribe or enforce a performance standard. These conditions are (1) if the application of measurement methodology to a particular class of sources is not practicable due to technological or economic limitations, or (2) if the pollutants cannot be emitted through a conveyance device. If a performance standard is not feasible to prescribe or enforce, then the Administrator may instead promulgate a design, equipment, work practice, or operational standard, or combination thereof.

A performance standard allows for some flexibility because any control technique may be used if it achieves the level of emission reduction represented by the standard. However, for most equipment leaks of VOC it is not feasible to prescribe a performance standard. Except in those cases in which standards can be set at "no detectable emissions," the only way to measure emissions from equipment leaking VOC would be to use a bagging technique for each piece of equipment. The great number of pieces of equipment and their distribution over large areas would make such a requirement economically impracticable for many plants.

Another approach for prescribing a performance standard would be to specify a number or percent of equipment that would be allowed to leak. The only equipment for which a leak frequency limit would be applicable is valves, because other pieces of equipment are too few in number to allow a meaningful percent to be determined. The variability in the percentage of leaking valves among process units precludes setting an allowable percentage of leaking valves that could necessarily be achieved by all process units within the industry. Therefore, establishing an allowable percentage of leaking valves applicable to all process units is not practicable. However, establishing an allowable percentage of leaking valves based on cost considerations associated with levels of performance is possible. If a process unit achieves the designated level of performance, then the owner or operator may elect to comply with an alternative standard for valves. This approach, which would add flexibility to the proposed standards, is discussed in more detail in the *Alternative Standards for Valves* section of this preamble.

Based on EPA's determination that it is infeasible to prescribe a performance standard for most equipment leaks of VOC at onshore natural gas plants, the alternative regulatory formats identified in Section 111(h) of the Act were considered. One possible format is an equipment standard. Equipment standards provide well-documented emission reductions. Determining compliance would require an initial check to ensure that the equipment had been installed properly and periodic checks to ensure that the equipment was continuing to operate properly. An inherent disadvantage associated with this type of format is less site-specific flexibility.

As indicated in the next section of this preamble, EPA reviewed the performance of equipment other than

the equipment selected as the basis for the proposed standards and is proposing to allow other equipment as alternatives to the equipment and work practices required by the proposed standards. These alternatives are allowed if they provide a reduction in emissions that is at least equivalent to the reductions achieved by the equipment or work practices required by the proposed standards. In addition, owners and operators of affected facilities would have additional flexibility because they could obtain EPA's approval to employ other equivalent techniques under Section 111(h)(3) and innovative techniques under the waiver provisions of Section 111(j).

Other formats include work practice, design, and operation standards. An example of the work practice format would be a program for leak detection and repair. Inspection methods, inspection time intervals, and time allowed for repair would be defined in detailing the work practices. Compliance with a work practice standard would be demonstrated by documenting that the work practices have been carried out. Rather than requiring specific control equipment or work practices, a design or operational format would require that a certain design representative of a level of control be attained or that certain conditions during operation of a process be achieved. For example, combustion devices may be required to be designed to achieve a specified level of control efficiency.

The proposed standards incorporate all of the possible formats. Different formats are required for different types of leaking equipment because characteristics of the equipment, the available emission control techniques, and the applicability of the measurement method used for equipment leaks differ. In the next section, the rationale for selecting a particular format is explained for each type of leaking equipment. For each type of leaking equipment, the feasibility of prescribing or enforcing a performance standard is discussed. If a performance standard is not feasible, the rationale for selecting another format is presented.

#### **Selection of Emission Limit, Equipment, Work Practice, Design and Operational Standards**

**Compressors.** The basis of the proposed standards for compressors is a closed-vent system to control leakage from the seal vent and distance piece area. Emission limits for compressors have not been proposed because the application of available measurement methods would not be practicable

because of technological or economic limitations. Thus, EPA proposes that the compressor be equipped with a seal area enclosure and closed vent system to carry the VOC emissions to a control device. The enclosure would capture all the emissions from the seal area. The closed vent system and control device would be required to comply with requirements discussed in the *Closed Vent Systems and Control Devices* portion of this section of the preamble.

For centrifugal compressors, mechanical seals with a barrier fluid system would be an equivalent alternative to a vent control system because they would achieve essentially 100 percent control of VOC emissions. In these instances, requirements must also be established to ensure the proper operation and maintenance of the equipment. A pressure or level indicator on the barrier fluid system would reveal any catastrophic failure of the seal or of the barrier fluid system. This indicator could be monitored in the control room or be equipped with an alarm to signal a failure of the system. Thus, a requirement to include an indicator to detect failure of the system is proposed, pursuant to Section 111(h), to ensure the proper operation and maintenance of the alternative mechanical seal system.

As mentioned in the *Selection of Affected Facilities* section of this preamble, there may be some cases in which distance pieces cannot be enclosed or seals with barrier fluid systems cannot be utilized with a closed vent system to a control device because some existing compressors cannot technologically or economically be retrofitted. For example, enclosing the distance piece and venting to a control device could require replacement of the distance piece on a reciprocating compressor or replacement of an entire reciprocating compressor. In these situations, determination of whether installation of the enclosure and venting system or its equivalent is technologically or economically feasible can take place during the determination of whether an existing compressor will be considered reconstructed and therefore affected by the standards. If EPA determines that an existing compressor cannot be technologically or economically retrofitted, then the compressor would not be required to comply with the standards.

**Open-Ended Valves or Lines.** The basis of the proposed standards is equipment that would enclose the open end. Bagging of this equipment for emission measurement or other techniques for measuring leak rates would not be economically or

technologically practicable. A "no detectable emissions" standard could not be selected as the format for the proposed standard because VOC could leak through the valve seat and become trapped in the line between the valve and the cap. The trapped VOC could be emitted to the atmosphere, even though the VOC emitted to the atmosphere would be much less than the VOC emitted without the enclosure. Thus, EPA selected the use of an equipment standard for control of equipment leaks of VOC from open-ended valves or lines.

Enclosure of the open end can be achieved by installing a cap, plug, or a second valve. The control efficiency associated with these techniques is approximately 100 percent, except when the line is used for draining, venting, or sampling operations. Thus, EPA is proposing standards that require open-ended valves or lines to be equipped with a cap, plug, or a second valve. If a second valve is used, the proposed standards require that the upstream valve be closed first, pursuant to Section 111(h). After the upstream valve is completely closed, the downstream valve must be closed. This operational requirement is necessary in order to prevent trapping process fluid between the two valves, which could result in a situation equivalent to the uncontrolled open-ended valve or line.

**Valves.** Valves could not reasonably be designed to release fugitive emissions to a conveyance, and bagging or other means of emission rate measurement is not reasonable. As discussed in the *Selection of Format for the Proposed Standards* section of this preamble, and allowable percentage of valves leaking cannot be selected as the basis for the proposed standard because of process unit variability. Similarly, a "no detectable emissions" limit cannot be prescribed, because, with the control techniques selected as the basis for the proposed standards, valves will still occasionally leak. Therefore, work practices consisting of periodic leak detection and repair programs were selected as the basis for the proposed standards for valves.

Several factors influence the level of emission reduction that can be achieved by a leak detection and repair program. The three main factors are the monitoring interval, leak definition, and repair interval. Training and diligence of personnel conducting the program, the adequacy of repair methods attempted, and other site-specific factors may also influence the level of emission reduction achievable; however, these factors are less quantifiable. The overall emission reduction of a leak detection and repair

program depends on the three main factors. Each of these three factors limits the effectiveness of the program. For example, if each of the factors selected for a leak detection and repair program represents a 90 percent effectiveness, then the overall effectiveness would be about 73 percent. Thus, the most effective definition that is reasonable for each factor should be selected.

The "monitoring interval" is the frequency at which individual equipment inspections are conducted. In selecting the basis of the proposed standards, EPA considered two regulatory alternatives for valves—monitoring at monthly intervals and monitoring at quarterly intervals. The incremental cost of monthly versus quarterly monitoring was judged to be reasonable for the additional emission reduction achieved by monthly valve monitoring. Consequently, monthly monitoring was selected as the basis of the standard. This judgment was based on emission reductions and costs calculated at the rate at which valve leaks typically occur at a gas plant.

However, EPA recognizes that some valves have lower leak occurrence rates than others. Monthly monitoring of valves that do not leak for 2 consecutive months was judged to be unreasonable when compared to the additional emission reduction achieved by monthly monitoring over quarterly monitoring. Therefore, although EPA is proposing that leak detection and repair programs include monthly monitoring for valves, the standard would allow quarterly monitoring for valves that have been found not leaking for 2 successive months.

Some valves are difficult to monitor because access to the valves is restricted. Difficult-to-monitor valves can be eliminated in new facilities but cannot be eliminated in existing facilities. Therefore, for facilities that become affected by a modification or reconstruction, EPA is proposing an annual leak detection and repair program for valves which are difficult to monitor. Valves which are difficult to monitor are defined as valves which would require elevating the monitoring personnel more than two meters above any readily available support surface. For new affected facilities, all valves would be subject to the proposed monthly leak detection and repair program.

The "leak definition" is the instrument reading observed during monitoring that would be used to determine which components have failed and need to be repaired. The best leak definition would be the one that achieved the most

emission reduction at reasonable costs. The emission reduction achieved would increase at the leak definition decreased, due to the increasing number of components that would be found leaking and, therefore, repaired. At a leak definition of 10,000 ppm, approximately 90 percent of VOC leaks from valves would be detected. It is well documented that valves that have been found leaking at levels of 10,000 ppm or greater can be brought to levels below 10,000 ppm with proper maintenance. Also, as a practical matter, most commonly available hydrocarbon detectors that are considered intrinsically safe have a maximum reading of 10,000 ppm. Leak definitions higher than 10,000 ppm could, nevertheless, be selected (and dilution probes could be used with portable detectors); however, there would be less emission reduction with the 10,000 ppm definition and no substantial associated cost savings. Consequently, there is no basis for selecting a leak definition greater than 10,000 ppm. A leak definition lower than 10,000 ppm may be practicable in the sense that leaks can be repaired to levels less than 10,000 ppm. However, EPA is unable to conclude that a leak definition lower than 10,000 ppm would provide additional emission reductions and, therefore, would be reasonable. Because the 10,000 ppm leak definition would address approximately 90 percent of the VOC leaks from valves at reasonable costs and at reasonable cost effectiveness, and because safe, available hydrocarbon detectors can read 10,000 ppm, the 10,000 ppm level was selected as the leak definition for valves. This definition was also considered appropriate for pumps and pressure relief devices. The same portable monitor used for valves would be used for these types of equipment, and consideration of other relevant factors did not indicate that the 10,000 ppm definition should be different for pumps or pressure relief devices.

The "repair interval" is the length of time allowed between the detection of a leaking piece of equipment and its subsequent repair. To provide the maximum effectiveness of the leak detection and repair program, the repair interval selected should require expeditious reduction of emissions but allow the owner or operator sufficient time to maintain flexibility in the overall maintenance schedule of the gas plant.

The length of the repair interval would affect emission reductions achievable by the leak detection and repair program because leaking equipment would be allowed to continue to leak for a given length of time. Repair intervals

of 5 and 15 days were evaluated. The effect on the emission reduction potential is proportional to the number of days the equipment is allowed to leak between detection and repair.

An initial attempt at repair of a leaking piece of equipment should be accomplished as soon as practicable after detection of the leak. Most repairs can be done quickly. A 5-day period provides sufficient time to schedule simple field repair. Attempting to repair the leak within 5 days will help maintenance personnel to identify the leaks that cannot be repaired with simple field repair or without shutdown of the affected facility.

Valves that are not repairable by simple field repair may require removal from the process for repair. Even repair intervals of 5 and 10 days could cause scheduling problems in repairing these valves. A 15-day interval provides time for isolating pieces of leaking equipment when equipment isolation is needed for repair beyond simple field repairs. A 15-day interval provides the owner or operator with sufficient time for determining precisely which spare parts are needed and provides sufficient time for flexibility in scheduling repair for these valves. In addition, a 15-day interval provides time for better determination of methods for isolating pieces of leaking equipment when equipment isolation is needed for repair beyond simple field repairs.

In general, a 5-day repair interval provides sufficient time to schedule simple field repair. A 15-day repair interval allows more efficient handling of more complex repair tasks while maintaining an effective reduction in equipment leaks. A repair interval of 30 or 45 days provides less effective reduction in emissions and does not substantially affect the ability to handle repair tasks. Thus, the proposed standards require an initial attempt to repair a leaking valve within 5 days and complete repair, except as discussed below, within 15 days.

Delay of repair beyond 15 days would be allowed for leaks that could not be repaired without shutting down an affected facility. In general, these leaks would have to be repaired at the next scheduled facility shutdown. Spare parts for valves can usually be stocked such that all leaks that could not be repaired without shutting down the affected facility could be repaired during the shutdown. Spare parts include packing gland bolts and valve packing material. In a few instances, replacement of the entire valve assembly would be required. EPA is proposing to allow delay of repair beyond an affected

facility shutdown for valves which require replacement of the entire valve assembly, provided the owner or operator can demonstrate that sufficient stock of spare valve assemblies had been maintained before the stock had been depleted.

**Alternative Standards for Valves.** The emission reduction and annual cost of the proposed leak detection and repair program depend in part on the number of leaking valves that are detected during monitoring. If very few valve leaks are detected in an affected facility, then the amount of VOC that could be reduced by the proposed program for valves is much smaller than the amount that could be reduced in a facility having more leaks. Additionally, the annual cost of the leak detection and repair program would be larger for an affected facility with fewer leaks than in an affected facility with more leaks, because the annual cost includes a recovery credit based on the amount of VOC reduced by the program. Thus, the annual cost per megagram of VOC emission reduction for the proposed leak detection and repair program varies with the number of valves which leak within an affected facility.

For example, a monthly leak detection and repair program for valves in VOC service, assuming 18 percent of valves leaking initially, results in zero net annual cost and achieves an annual VOC emission reduction of 43 Mg for a typical process unit. In contrast, for a typical process unit with 2.0 percent of the valves leaking on the average, a monthly leak detection and repair program results in an annual cost of about \$7,000 and achieves an annual emission reduction of 5.2 Mg. For a typical process unit with 0.5 percent of the valves leaking on the average, a monthly leak detection and repair program results in an annual cost of \$7,400 and achieves an annual emission reduction of about 1.5 Mg. As explained previously, although the standard is based on monthly monitoring, it actually allows monthly/quarterly monitoring, which reduces the costs.

There is no precise breakpoint in the annual cost and emission reduction relationship. However, EPA judges that the emission reduction and annual cost relationship is unreasonably high for process units that over an extended period have fewer than 1.0 percent of valves leaking. Based on this judgment, an allowable percent of valves leaking was determined that reflects the long-term average of 1.0 percent of valves leaking, as discussed below.

Due to the variability inherent in valve leak detection, a process unit that averages less than 1.0 percent of valves

leaking will have, at times, more than 1.0 percent of valves leaking. The variability in valve leak detection can be characterized as a binomial distribution. Provision for the variability in leak detection is accomplished by straightforward statistical techniques based on the binomial distribution. An allowable percent of valves leaking of 2.0 percent, to be achieved at any point in time, would provide an owner or operator a risk of about 5 percent that greater than 2.0 percent of valves would be determined leaking when the average of 1.0 percent was actually being achieved. Based on these considerations, EPA considers an allowable percent of valves leaking of 2.0 percent to represent an average of 1.0 percent of valves leaking.

EPA is proposing two alternative standards which would exempt valves within process units from the required (monthly/quarterly monitoring) leak detection and repair program. Owners or operators of affected facilities may identify and elect to achieve either of the alternative standards. The alternative standards would allow owners or operators to tailor leak control programs to their own operations. An owner or operator would report which alternative standard he had identified and elected to achieve.

The first alternative standard would limit the maximum percent of valves leaking within an affected facility to 2.0 percent. As previously pointed out in the *Selection of Format for the Proposed Standards* section of this preamble, an industry-wide performance standard which could reasonably be achieved at all facilities was not possible for valves. This was due to the variability in valve leak frequency and variability in the ability of a leak detection and repair program to reduce these leaks among all affected facilities within the industry. However, this alternative standard would allow any affected facility the option of complying with an allowable percent of valves leaking for a particular affected facility. Choosing this alternative standard would allow for the possibility of different leak detection and repair programs and substitution of engineering controls (e.g., valves designed to leak less frequently) at the discretion of the owner or operator. This alternative standard would also eliminate a large part of the recordkeeping associated with the monthly/quarterly leak detection and repair program for valves.

Performance tests, as specified in 40 CFR 60.8(f), require three runs. However, three runs for performance tests to determine the percent of valves leaking are unnecessary and would be

inconsistent with the performance standard, which is based on leak frequency at any time. Thus, performance tests for valves complying with the percent leak frequency alternative are exempt from § 60.8(f) in the proposed standards; a performance test will consist of only one run. However, this alternative standard would require a minimum of one performance test per year. Additional performance tests could be requested by EPA. If the results of a performance test showed that greater than 2.0 percent of the valves leak, the owner or operator would be in violation of the proposed standards.

In certain circumstances, an owner or operator may want to request a waiver of future tests as provided in the General Provisions of 40 CFR Part 60. This would provide flexibility for owners and operators of onshore natural gas processing plants where, for whatever reason, routine leak detection and repair is not needed to effectively control emissions. This would include gas plants that use superior equipment or that simply do not leak for unexplained reasons. Based on performance tests that demonstrate the achievability of the 2.0 percent standard and information that indicates that this standard would be achieved on a continuing basis, EPA could waive the annual performance tests.

The second alternative standard would allow the use of skip-period leak detection for valves. Under skip-period leak detection, an owner or operator could skip from routine leak detection for valves to less frequent leak detection. This skip-period leak detection program would require that a performance level of 2.0 percent be achieved on a continuous basis with more than 90 percent certainty. An owner or operator would choose one of two skip-period leak detection programs for valves and then implement that one program. The first skip-period leak detection program could be used when fewer than 2.0 percent of the valves had been leaking for two consecutive quarterly leak detection periods. The first skip-period leak detection program would allow an owner or operator to skip every other quarterly leak detection period; that is, leak detection can be performed semi-annually. Under the second skip-period leak detection program, if fewer than 2.0 percent of the valves had been leaking for five consecutive quarterly leak detection periods, the owner or operator may skip three quarterly leak detection periods; that is, leak detection can be performed annually. When more than 2.0 percent of

valves are found to leak, monthly/quarterly leak detection would be required to be resumed.

**Pumps.** As with some of the previously discussed equipment, pumps are generally not designed to leak VOC emissions to a conveyance. Because of the difficulty of routinely bagging pumps, bagging of this equipment for emission measurement would not be economically or technologically practicable. Even though leaking pumps can be detected, the small number of pumps within process units does not allow the establishment of a performance standard. A "no detectable emissions" limit cannot be prescribed because, with the control technique selected as the basis for the proposed standards, pumps can still leak.

In the analysis for the basis for the proposed standards, EPA selected a work practice consisting of periodic leak detection and repair program for pumps. As with valves, the effectiveness of the leak detection and repair program for pumps is limited by the selection of the monitoring interval, leak definition, and repair interval. The same leak definition and repair interval selected for valves were selected for pumps for the reasons discussed previously. Monthly monitoring was selected as the monitoring interval for pumps based on cost considerations, as discussed in the *Selection of the Basis for the Proposed Standards* section of this preamble. One month provides the most effective leak detection and repair program for pumps without imposing difficulties or unreasonable cost in implementing the program.

Several types of pumps with ancillary equipment can achieve emission reductions of VOC at least equivalent to that achieved by the monthly leak detection and repair program for pumps. These include dual mechanical seal systems that utilize a barrier fluid between the seals, enclosure of the pump seal area, and sealless pumps. If the barrier fluid in a dual seal system is maintained at a pressure greater than the pump stuffing box pressure, any leakage between the seals would be from the barrier fluid to the process fluid, so no process fluid would be emitted to the atmosphere. If the pump stuffing box pressure is greater than the barrier fluid pressure (for example, tandem seals), the barrier fluid collects the leakage from the inner seal. The process fluid collected by the barrier fluid is controlled by either (1) connecting the barrier fluid degassing system to a control device with a closed vent system, or (2) by returning the barrier fluid to the process stream.

Because these dual mechanical seal systems are at least equivalent to a monthly leak detection and repair program for pumps, owners or operators may elect to use dual mechanical seals rather than implement the monthly monitoring program.

Section 111(h) of the Clean Air Act requires that when equipment standards, such as a dual mechanical seal requirements, are established, requirements must also be established to assure the proper operation and maintenance of the equipment. As stated previously for mechanical seals in compressors, a pressure or level indicator on the barrier fluid system would reveal any catastrophic failure of the inner or outer seal, or of the barrier fluid system. This indicator could be monitored in the control room or equipped with an alarm to signal a failure of the system. Thus, EPA is proposing requirements to assure the proper operation and maintenance of the dual mechanical seal system.

Sealless pumps, such as diaphragm or canned pumps, do not have a potential leak area and, therefore, are at least equivalent to monthly leak detection and repair and dual seal systems. As with other leakless equipment, the proposed standard requires an initial performance test, using the procedures specified in Reference Method 21, to verify that the piece of leakless equipment meets the "no detectable emissions" limit and annual rechecks to ensure continued operation with "no detectable emissions." An instrument reading of less than 500 parts per million by volume (ppm) above a background concentration based on Reference Method 21 can be used to indicate whether VOC leaks have been eliminated, that is, that the equipment has "no detectable emissions."

In many cases, the seal area of a pump could be completely enclosed, and this enclosed area could be connected with a closed vent system to a control device. The control efficiency of this arrangement is dependent on the control efficiency of the combustion or vapor recovery system. The closed vent system could require a flow-inducing device to transport emissions from the seal area to the control device. Some owners or operators may decide that this approach is preferable to leak detection and repair. Enclosing the seal area and venting the captured emissions to a control device by means of a closed vent system is a reasonable alternative because this system would be at least as effective as a monthly leak detection and repair program. Therefore, the EPA is proposing to allow pumps to be

equipped with enclosed seal areas that are connected to a control device by a closed vent system in accordance with the requirements for these systems discussed below in the *Closed Vent System and Control Device* portion of this section.

**Pressure relief devices.** Pressure relief devices could not reasonably be designed to leak VOC emissions to a conveyance, and bagging or other means of emission rate measurement is not reasonable. A performance standard that prescribes an allowable percentage of pressure relief devices leaking is infeasible due to process unit variability. A "no detectable emissions" limit would be possible only if the standard were based on the use of rupture discs; this control technology was rejected as the basis for the standard for cost reasons.

Work practices consisting of periodic leak detection and repair programs were selected as the basis for the proposed standard for pressure relief devices. For reasons discussed previously, the leak definition selected for pressure relief devices is 10,000 ppm, and the repair interval selected is 15 days. Quarterly monitoring was selected as the monitoring interval for pressure relief devices based on incremental cost considerations, as discussed in the *Selection of the Basis for the Proposed Standards* section of this preamble. Quarterly monitoring provides the most effective leak detection and repair program for pressure relief devices without imposing unreasonable costs in implementing the program. In addition, pressure relief devices would be required to be monitored within 5 days after each overpressure to determine if a leak has occurred as a result of the overpressure.

In addition to the quarterly leak detection and repair program, EPA considered the use of rupture discs or closed vent systems with control device as equivalent alternatives. When the integrity of rupture discs is maintained, equipment leaks of VOC through the relief device are eliminated. Rupture discs maintain their integrity unless an overpressure occurs. After the occurrence of an overpressure, replacement of the rupture disc once again eliminates equipment leaks of VOC through the pressure relief device.

For control techniques that eliminate equipment leaks, such as the use of rupture discs, a "no detectable emissions" limit is feasible. An instrument reading of less than 500 parts per million by volume (ppm) above a background concentration based on Reference Method 21 can be used to

indicate whether equipment leaks have been eliminated, that is, that the equipment has "no detectable emissions."

The alternative "no detectable emission" limit would not apply to discharges through the pressure relief device during overpressure relief because the function of relief devices is to discharge process fluid, thereby reducing dangerous high pressures within the equipment. The standard would specify, however, that the relief device be returned to a state of "no detectable emissions" within 5 days after such a discharge. The standard would further require an annual test to verify the "no detectable emissions" status of the pressure relief devices.

If a closed vent system is not open to the atmosphere, and the control device complies with the requirements discussed in the *Closed Vent Systems and Control Devices* portion of this section of the preamble, then its reduction in VOC emissions would be at least equivalent to the reduction achieved with the quarterly leak detection and repair program. Based on these considerations, EPA is proposing to allow rupture discs or closed vent systems with control devices as equivalent alternatives to the quarterly leak detection and repair program for pressure relief devices.

*Closed Vent Systems and Control Devices.* Control devices would be used to reduce VOC captured and transported through closed vent systems. These control devices, which are present for purposes unrelated to this proposed standard, would be designed to dispose of organic vapor streams from other sources in the plant. Because the streams from the closed vent systems will usually be low-flow or intermittent in comparison to streams from other sources, emissions in closed vent streams will often contribute a very small and varying portion of the total organic vapor stream going to the control device. Measurement techniques that reflect the effectiveness of these control devices to reduce equipment leaks of VOC are limited. Because these techniques would require costly material balancing of the VOC entering the control devices, it is not economically practicable to measure the emissions from these control devices. For this reason an emission standard is not proposed for control devices used to reduce VOC that are captured and transported by closed vent systems.

Control devices were selected as part of the best technological system of emission reduction for some equipment leaks of VOC (such as compressors) and are part of alternative approaches to

achieving compliance with the standards for other equipment (such as pumps). These control devices would already be in place in most existing gas plants and, therefore, would not be designed solely to reduce equipment leaks of VOC. These existing control devices provide varying degrees of emission reduction; therefore, selecting standards of performance for these devices may not reflect the emission reduction capability of the best control devices nor the capability of devices specifically designed for control of equipment leaks of VOC.

Flares are presently used in gas plants mainly as a means of handling emergency releases from various processes within the gas plant. According to the current knowledge of flare design, the best available flare design or state-of-the-art flare design is the smokeless flare. Smoking flares are environmentally less desirable because they emit particulates.

There are a number of techniques currently in use within industry which help flares achieve smokeless operation. One technique involves the use of staged elevated flare systems, where a small diameter flare is operated in tandem with a large diameter flare. The system is designed such that the small flare takes the continuous low flow releases and the larger flare accepts emergency releases. A second technique involves the use of a small, separate conveyance line to the flare tip in order to maintain a high exit velocity for the continuous low flow, low pressure gas flow. A third technique, sometimes used in conjunction with either of the above techniques, involves the use of continuous flare gas recovery. In the third technique, a compressor is used to recover the continuously generated flare gas "base load." The compressor is sized to handle the "base load," and any excess gas is flared. These techniques can be used to help provide smokeless operation of a flare which is used to reduce fugitive emissions of VOC that are captured and transported by closed vent systems.

In recent tests, smokeless steam-assisted flares, smokeless air-assisted flares, and smokeless flares with no assist were found to be as efficient as enclosed combustion devices in destroying VOC over a broad range of operating conditions if the heat content of the flared gas is maintained above a certain minimum, and the velocity of the gas at the flare tip is maintained below a certain maximum. Based on the test data and a comparison of vent stream characteristics between the test data and equipment leaking VOC, EPA believes that the destruction efficiency

of smokeless flares used in natural gas processing plants would be at least 98 percent.

Enclosed combustion devices can be designed and operated to achieve VOC emission reductions of at least 98 percent. Vapor recovery systems can be readily designed and operated to achieve VOC emission reductions of at least 95 percent. Existing enclosed combustion devices and vapor recovery systems may not achieve the VOC emission reduction efficiencies that new control devices achieve. However, existing control devices achieve a VOC reduction efficiency of at least 95 percent.

EPA selected a VOC reduction efficiency of 95 percent for control devices used to reduce equipment leaks of VOC. EPA considers the use of enclosed combustion devices and flares achieving 98 percent emission reduction too costly to add to a process unit solely to control VOC leaks in light of the presence of existing control devices that can achieve 95 percent control. Thus, because EPA believes that flares with no assist, steam, or air assist in onshore natural gas plants can achieve at least 98 percent VOC reduction efficiency if designed for smokeless operation and that existing control devices, such as enclosed combustion devices and vapor recovery systems, will achieve at least 95 percent VOC reduction efficiency, EPA selected a VOC reduction efficiency of 95 percent.

EPA selected design and operational requirements for flares, enclosed combustion devices, and vapor recovery systems that reflect application of the best technological system of emission reduction for control devices used to reduce equipment leaks of VOC. The design and operation requirements for flares, discussed above, require smokeless operation and the presence of a flame. The presence of a flame can be ensured by monitoring the flare's pilot light with a thermocouple or some other heat sensor connected to an alarm. Smokeless operation of the flare is ensured through visible emission requirements. The proposed standards would limit visible emissions from a flare to less than 5 minutes in any 2-hour period. Many natural gas plants currently comply with State limits similar to this requirement. In addition, only steam-assisted flares, air-assisted flares, or flares with no assist could be used. Steam-assisted flares would have to be operated with exit velocities less than 18 m/sec (60 ft/sec), under standard conditions, combusting gases with heating values of 11.2 MJ/scm (300 Btu/scf) or greater. Air-assisted flares

would have to be operated with heating values of 11.2 MJ/scm (300 Btu/scf) or greater and with exit velocities equal to, or less than, that velocity determined by the equation specified in the regulation. The actual velocity would be calculated by dividing the gas flow (in standard units), as determined by the methods specified in the regulation, by the unobstructed (free) cross section area of the flare tip. Flares operated without assist would have to be operated with exit velocities less than 18 m/sec (60 ft/sec), under standard conditions, combusting gases with heating values of 7.4 MJ/scm (200 Btu/scf) or greater. Because enclosed combustion devices and vapor recovery systems exist that provide at least 95 percent emission reduction, a 95 percent emission reduction design requirement is proposed for these control devices. For enclosed combustion devices that do not use catalysts to aid in combustion of organic vapor streams, provisions for a minimum vapor residence time of 0.75 seconds at a minimum temperature of 816° C will be considered equivalent to at least a 95 percent emission reduction efficiency.

*Miscellaneous.* Pumps and valves in heavy liquid service, pressure relief devices in light liquid and heavy liquid service, and flanges and other connectors in all services would be excluded from the routine monitoring and inspection requirements on the basis of data from EPA testing. However, if leaks are detected from this equipment, the same allowable repair interval which applies to pumps, pressure relief devices, and valves would apply.

Individual flanges in process units have very low emission rates; and although they represent 76 percent of the total number of equipment leaking VOC in gas plants, their total contribution to overall emissions is about 14 percent. In EPA testing of equipment leaking VOC in refineries, pumps and valves in heavy liquid service, and pressure relief devices in light liquid and heavy liquid VOC service also exhibited very low emission rates. This equipment contributes less than 1 percent of all emissions from refineries. EPA did not test pumps and valves in heavy liquid service and pressure relief devices in light liquid and heavy liquid service at gas plants. However, it is reasonable to conclude that these sources would contribute a very low percentage of all emissions at gas plants as well as at refineries. Including pumps and valves in heavy liquid service, pressure relief devices in light liquid and heavy liquid service, and flanges and other

connectors in all services in the monitoring and equipment requirements would result in an unreasonably high cost per megagram. Consequently, these equipment are excluded from those requirements.

Also excluded would be equipment operating under a vacuum because leaks to the atmosphere would not occur while the equipment is operated at subatmospheric internal pressures.

#### *Selection of Recordkeeping and Reporting Requirements*

Recordkeeping would be required by the proposed standards to provide documentation for the assessment of compliance with (1) work practice standards, (2) equipment standards, (3) design standards, (4) emission standards, and (5) operational standards. Review of records would provide information for enforcement personnel to assess implementation of the proposed standards. Compliance with the proposed standards would be determined by inspection and review of records.

Three recordkeeping alternatives were considered in evaluating the amount of recorded information needed to assess compliance with the proposed standards. The first alternative would be to require no formal recordkeeping. If recorded documentation of the proposed standards were not required, no mechanism would be provided for checking the thoroughness of efforts to reduce VOC leaks. Many owners or operators would institute recordkeeping requirements to manage the efforts of their plant personnel. However, some owners or operators might not institute such programs, and owners who would institute them might not know what information would be pertinent to enforcement of the standards.

The second alternative would require recordkeeping to document results of the leak detection and repair program and information relating to equipment specifications. Information would be recorded in sufficient detail to enable owners or operators to ensure that their emission reduction programs are being implemented effectively and to demonstrate compliance with the proposed standards. This alternative would require the maintenance of quantitative records of repaired and unrepaired leaking equipment. This alternative would require only that amount of records necessary to manage implementation of the required programs (and certain alternative valve programs, if selected) and to ensure the effective implementation of the proposed standards.

The third alternative would require recordkeeping of all the information generated by the proposed standards. This information would include, for example, the meter reading (ppm) detected for all components monitored at a given facility. Much of this information would be necessary for managing implementation of the required programs or for ensuring the effective implementation and maintenance of the proposed standards.

The second alternative was selected as the basis for the recordkeeping requirements of the proposed standards. This alternative would provide the necessary records for managing implementation of the required programs while ensuring effective implementation and maintenance of the proposed standards.

Specific information pertaining to the leak detection and repair would be recorded. Each valve found to be leaking during the first month of a quarter would be identified with a readily visible weatherproof identification. Each pump found to be leaking during a monthly monitoring would also be identified. The identifications could be a tag attached to the valve or pump or a number designation permanently marked on the valve or pump. The identification could be removed after a valve is repaired and found not to leak for the next 2 successive months. The identification also could be removed after a pump is repaired.

A log would be maintained to record the efforts by an owner or operator pertaining to the leak detection and repair program. The log would contain the instrument and operator identification numbers, the leaking equipment identification number, the date of detection of the leaking equipment, the date of the first attempt to repair the leaking equipment, repair methods applied to repair the equipment, and the date of final repair. The log would be kept for 2 years following the survey. If the leaking equipment could not be repaired within 15 days, the reasons for unsuccessful repair and the date of anticipated successful repair would be recorded on the leak report form. Once the leaking equipment was successfully repaired, the date of repair would be recorded. These records would be needed to provide the information necessary to allow the owner or operator to evaluate the effectiveness of repair efforts and to allow enforcement personnel to assess compliance with the work practice standards. If the owner or operator elects to implement the alternative standard for valves that allows skip-

period leak detection, he or she must also record the percentage of valves found leaking during each leak detection period.

For equipment specifications, records would be maintained of the dates of installation, start-up, equipment repair, and equipment modifications. The dates and descriptions of any control equipment failures would also be recorded. These records would be needed to provide information necessary to allow enforcement personnel to assess the effectiveness of implementation and maintenance of equipment standards.

For design standards, records would be maintained of the location and type of equipment to which the standards apply. As an example, if a combustion source is used as a VOC emission control device, then the design fuel and air usage rates, the firebox volume, and the average firebox temperature and other design specifications would be recorded.

Reporting requirements were also considered for the proposed standards. Three alternatives were considered in evaluating the reporting information needed to assess compliance with the proposed standards. These alternatives represent varying levels of enforcement monitoring of the proposed standards. Enforcement personnel would review the reports submitted by industry personnel on the status of implementing the proposed standards. Review of reports reduces the need for in-plant inspections.

The first alternative would require no formal reporting of compliance with the proposed standards other than notifications of construction, anticipated startup and actual startup, and an intention to comply with one of the alternative standards discussed in this preamble. This alternative would not provide a mechanism for routinely verifying industry's efforts to reduce equipment leaks of VOC. Thus, compliance with the proposed standards would be assessed through in-plant inspections.

The second reporting alternative would require the submittal of information in sufficient detail to ensure the implementation and maintenance of the proposed standards. These requirements would stipulate the submittal of semiannual reports. Included in the reports would be a summary of information on the leaking equipment that had been detected during the 6-month period. The semiannual reports would contain summary data of the number of leaks found, the number not repaired within 15 days, and the reasons for nonrepair.

This requirement would provide enforcement personnel with an overview of the repair of leaking equipment.

The third reporting alternative would require the submittal of all the information obtained while conducting leak detection and repair programs. This information would include the information reported in the second alternative and, additionally, comprehensive information on all tested equipment. This reporting alternative would necessitate the reporting of all information included in the recordkeeping requirements and, therefore, would require more resources than the second alternative.

The second alternative was selected as the reporting requirement for the proposed standards. This alternative provides sufficient information to assess implementation of the work practice requirements without requiring excessive resources from industry and enforcement personnel (e.g., reduces the need for in-plant inspections). The first alternatives was not selected because implementation of work practice standards could not be assessed adequately by enforcement personnel to ensure that reductions in emissions from leaking equipment were achieved. The third reporting alternative was not selected because the additional resources expended by industry would not facilitate assessment of compliance enough to warrant the increased expense.

In addition to the requirements for semiannual reports, the reporting requirements of the General Provisions and the reporting of the intention to comply with an alternative standard for valves would apply. The requirements for semiannual reports are waived as to affected sources in States where the program has been delegated if EPA, in the course of delegation, approves reporting requirements or an alternative means of source surveillance adopted by the State. Such sources would be required to comply with the requirements adopted by the State.

The Paperwork Reduction Act of 1980 (Pub. L. 96-511) requires clearance from the Office of Management and Budget (OMB) of reporting and recordkeeping requirements that qualify as an "information collection request" (ICR). For the purposes of OMB's review, an analysis of the burden associated with the reporting and recordkeeping requirements of this regulation has been made. During the first 2 years of this regulation, the average annual burden of the reporting and recordkeeping requirements would be about 6.6 person-

years, based on an average of 44 respondents per year.

#### *Equivalent Means of Emission Limitation*

Under the provisions of Section 111(h) of the Clean Air Act, if the Administrator establishes work practices, equipment, design or operational standards, then the Administrator must allow the use of equivalent means of emission limitations if they achieve a reduction in air pollutants equivalent to that achieved under requirements of a standard of performance. Sufficient data would be required to show equivalency, and opportunity for a public hearing would be required.

Individual owners or operators could request equivalent means of emission limitation for specific requirements, such as the proposed equipment requirements and the proposed leak detection and repair program. Sufficient information would have to be collected by a facility to demonstrate that the control techniques would be equivalent to the control techniques required by the proposed standards. This information would then be submitted to EPA in a request for a determination of equivalence. If the Administrator believes that an equivalency request may be approved, a notice to announce the opportunity for a public hearing would be published in the **Federal Register**. After public notice and opportunity for public hearing, the Administrator would determine equivalence and would publish that determination in the **Federal Register**.

#### **Public Hearing**

There will be an opportunity for a public hearing to discuss these proposed standards in accordance with Section 307(d)(5) of the Clean Air Act. Persons wishing to make oral presentations should contact EPA at the address given in the **ADDRESSES** section of this preamble. Oral presentations will be limited to 15 minutes each. Any member of the public may file a written statement before, during, or within 30 days after the hearing. Written statements should be addressed to the Central Docket Section address given in the **ADDRESSES** section of this preamble and should refer to Docket Number A-80-20-B.

A verbatim transcript of the hearing and written statements will be available for public inspection and copying during normal working hours at EPA's Central Docket Section in Washington, D.C. (see **ADDRESSES** section of this preamble).

**Docket**

The docket is an organized and complete file of all the information submitted to or otherwise considered by EPA in the development of this proposed rulemaking. The principal purposes of the docket are: (1) to allow members of the public and industries involved to identify and locate documents so they can effectively participate in the rulemaking process, and (2) to serve as the record in case of judicial review, except for interagency review material (section 307(d)(7)(A)).

**Miscellaneous**

As prescribed by Section 111 of the Clean Air Act, establishment of standards of performance for the onshore crude oil and natural gas production industry was preceded by the Administrator's determination (40 CFR 60.16, amended at 47 FR 951, dated January 8, 1982) that this industry contributes significantly to air pollution that may reasonably be anticipated to endanger public health or welfare. In accordance with Section 117 of the Act, publication of this proposal was preceded by consultation with appropriate advisory committees, independent experts, and Federal departments and agencies. EPA welcomes comments on all aspects of the proposed regulations, including economic and technological issues.

This regulation will be reviewed 4 years from the date of promulgation. This review will include an assessment of such factors as the need for integration with other programs, the existence of alternative methods, enforceability, improvements in emission control technology, and the reporting requirements.

The reporting and recordkeeping (information collection) provisions associated with the proposed standards (40 CFR 60.7, 60.8, 60.636 and 60.637) will be submitted for approval to the Office of Management and Budget (OMB) under Section 3504(h) of the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 *et seq.* The final rule will explain how the reporting and recordkeeping requirements respond to any OMB or public comments.

Section 317 of the Clean Air Act requires the Administrator to prepare an economic impact assessment for any new source standard of performance promulgated under Section 111(b) of the Act. An economic impact assessment was prepared for the proposed regulations and for other regulatory alternatives. All aspects of the assessment were considered in the formulation of the proposed standards

to insure that the proposed standards would represent the best system of emission reduction considering costs. The economic impact assessment is included in the background information document.

**"Major Rule" Determination.** Under Executive Order 12291, the Administrator is required to judge whether a regulation is a "major rule" and, therefore, is subject to certain requirements of the Order. The Administrator has determined that this regulation would result in none of the adverse economic effects set forth in Section 1 of the Order as ground for finding a regulation to be "major rule." Fifth-year net annual costs (after accounting for recovery credits) of the proposed standards would be as much as \$2.5 million for the 220 newly constructed, modified, and reconstructed production facilities projected that could be affected by the standards during the first 5 years. Price increases from implementation of these proposed standards would be less than 0.1 percent. This is because the annualized cost is a small fraction of the yearly revenue expected for the new, modified, and reconstructed units affected during the 5-year period. The Administrator has also concluded that this rule is not "major" under any of the criteria established in the Executive Order.

As discussed in the *Selection of the Basis of the Proposed Standards* section of this preamble, EPA considered annual costs in relation to the extent of VOC emission reduction achieved during selection of the proposed standards. The annual cost per megagram of VOC emission reduction is summarized in Table 1 for a new, intermediate-size natural gas plant that would be affected by the proposed standards. The incremental differences between the annual costs per megagram of VOC emission reductions under the proposed standards and the next less restrictive level of control are also summarized in Table 1.

This regulation was submitted to the Office of Management and Budget (OMB) for review as required by Executive Order 12291. Any comments from OMB to EPA and any EPA responses to those comments are available for public inspection in Docket Number A-80-20-B, Central Docket Section, at the address given in the ADDRESSES section of this preamble.

**Regulatory Flexibility Analysis Certification.** The Regulatory Flexibility Act of 1980 requires that adverse effects of all Federal regulations upon small businesses be identified. Current criteria stipulate that a regulatory flexibility

analysis must be prepared if 20 percent of the small businesses would suffer "significant impacts." According to current Small Business Administration guidelines, a small business in the gas production industry is one that has 500 employees or less. It is unlikely that any onshore natural gas plant that would be subject to these proposed standards would qualify as a small business. Even if there were any plants that would qualify as small businesses, none would suffer significant impacts. This conclusion is based on the fact, in doing the economic analysis for this proposal, the price increase and profitability impacts have been estimated from the perspective of the smaller facilities in operation. Therefore, the finding that the annual cost of the proposed standards would be less than 0.1 percent of the yearly revenue expected for plants affected by the proposed standards, accurately reflects the impacts for small natural gas plants.

Pursuant to the provisions of 5 U.S.C. 605(b), I hereby certify that this rule will not have a significant economic impact on a substantial number of small entities.

**List of Subjects in 40 CFR Part 60**

Air pollution control, Aluminum, Ammonium sulfate plants, Asphalt, Cement industry, Coal, Copper, Electric power plants, Glass and glass products, Grains, Intergovernmental relations, Iron, Lead, Metals, Metallic minerals, Motor vehicles, Nitric acid plants, Paper and paper products industry, Petroleum, Phosphate, Sewage disposal, Steel Sulfuric acid plants, Waste treatment and disposal, Zinc, Tires, Incorporation by reference, Can surface coating, Sulfuric acid plants, Industrial organic chemicals, Organic solvent cleaners, Fossil fuel-fired steam generators.

Dated: January 11, 1984.

William D. Ruckelshaus,  
Administrator.

**PART 60—[AMENDED]**

It is proposed that 40 CFR Part 60 be amended by adding a new subpart as follows:

**Subpart KKK—Standards of Performance for Onshore Natural Gas Processing Plants: Equipment Leaks of VOC**

Sec.

60.630 Applicability and designation of affected facility.

60.631 Definitions.

60.632-1 Standards: General.

60.632-2 Standards: Pumps in light liquid service.

60.632-3 Standards: Compressors.

## Sec.

- 60.632-4 Standards: Pressure relief devices in gas/vapor service.  
 60.632-5 Standards: Open-ended valves or lines.  
 60.632-6 Standards: Valves in gas/vapor and light liquid service.  
 60.632-7 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid and in heavy liquid service, and flanges and other connectors.  
 60.632-8 Standards: Delay of repair.  
 60.632-9 Standards: Closed-vent systems and control devices.  
 60.633-1 Alternative standards for valves—allowable percentage of valves leaking.  
 60.633-2 Alternative standards for valves—skip period leak detection and repair.  
 60.634 Equivalent means of emission limitation.  
 60.635 Test methods and procedures.  
 60.636 Recordkeeping requirements.  
 60.637 Reporting requirements.

Authority: Sec. 111 and 301(a) of the Clean Air Act, as amended, (42 U.S.C. 7411, 7601(a)), and additional authority as noted below.

### Subpart KKK—Standards of Performance for Onshore Natural Gas Processing Plants: Equipment Leaks of VOC

#### § 60.630 Applicability and designation of affected facility.

(a)(1) The provisions of this subpart apply to affected facilities in onshore natural gas processing plants.

(2) A compressor in VOC service is an affected facility.

(3) The group of all equipment within a process unit is an affected facility.

(b) Any affected facility under paragraph (a) of this section that commences construction or modification after January 20, 1984 would be subject to the requirements of this subpart.

(c) Addition of replacement of equipment for the purpose of process improvement that is accomplished without a capital expenditure shall not by itself be considered a modification under this subpart.

(d)(1) Affected facilities covered by Subpart VV or Subpart GGG of 40 CFR Part 60 are excluded from this subpart.

(2) If the equipment is subject to the provisions of this subpart and 40 CFR Part 61 Subpart J, the equipment will only be required to comply with the provisions of 40 CFR Part 61 Subpart J.

(e) The provisions of this subpart do not apply to compressor stations, dehydration units, sweetening units, underground storage facilities, field gas gathering systems, and liquefied natural gas units unless the facility is located at an onshore natural gas processing plant.

#### § 60.631 Definitions.

As used in this subpart, all terms not defined herein shall have the meaning

given them in the Act or in Subpart A of Part 60, and the following terms shall have the specific meanings given them:

"Closed-vent system" means a system that is not open to the atmosphere and that is composed of piping, connections, and, if necessary, flow-inducing devices that transport gas or vapor from a compressor or from a piece (or pieces) of equipment to a control device.

"Connector" means flanged, screwed, welded, or other joined fittings used to connect two pipe lines or a pipe line and a piece of process equipment.

"Control device" means an enclosed combustion device, vapor recovery system, or flare.

"Distance piece" means an open or enclosed casing through which the piston rod travels, separating the compressor cylinder from the crankcase.

"Equipment" means each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector that is in VOC service and any device or system required by this subpart.

"Field gas" means feedstock gas entering the natural gas plant.

"First attempt at repair" means to take rapid action for the purpose of stopping or reducing leakage of organic material to atmosphere using best practices.

"In gas/vapor service" means that the compressor or the piece of equipment contains fluid that is in the gaseous state at operating conditions.

"In heavy liquid service" means that the piece of equipment is not in gas/vapor service or in liquid service.

"In light liquid service" means that the piece of equipment contains a liquid that meets the conditions specified in § 60.635(e).

"Natural gas liquids" means the hydrocarbons, such as ethane, propane, butane, and pentane, that are extracted from field gas.

"Natural gas processing plant" (gas plant) means any processing site engaged in the separation of natural gas liquids from field gas, fractionation of mixed natural gas liquids to natural gas products, or both.

"Onshore" means situated on land as opposed to over sea water.

"Open-ended valve or line" means any valve, except pressure relief valves, having one side of the valve seat in contact with process fluid and one side that can be open to the atmosphere, either directly or through open piping.

"Pressure release" means the emission of materials from processes resulting from the system pressure being greater than the set pressure of the pressure relief device.

"Process improvement" means routine changes made for safety and occupational health requirements, for energy savings, for better utility, for ease of maintenance and operation, for correction of design deficiencies, for bottleneck removal, for changing product requirements, or for environmental control.

"Process unit" means equipment assembled for the separation of natural gas liquids from field gas, the fractionation of the liquids into natural gas products, or other operations associated with the processing of natural gas products. A process unit can operate independently if supplied with sufficient feed or raw materials and sufficient storage facilities for the products.

"Process unit shutdown" means a work practice or operational procedure that stops production from a process unit or part of a process unit. The use of spare equipment and technically feasible bypassing of equipment without stopping production are not process unit shutdowns.

"Quarter" means a 3-month period; the first quarter concludes on the last day of the last full month during the 180 days following initial startup.

"Reciprocating compressor" means a piece of equipment that increases the pressure of a process gas by positive displacement, employing linear movement of the driveshaft.

"Repaired" means that equipment is adjusted, or otherwise altered, to eliminate a leak as indicated by one of the following: an instrument reading of 10,000 ppm or greater, indication of liquids dripping, or indication by a sensor that a seal or barrier fluid system has failed.

"Sensor" means a device that measures a physical quantity or the change in a physical quantity, such as temperature, pressure, flow rate, pH, or liquid level.

"In vacuum service" means that equipment is operating at an internal pressure that is at least 5 kilopascals (kPa) below ambient pressure.

"In VOC service" means that the piece of equipment or the compressor contains or contacts a process fluid that is at least 1.0 percent VOC by weight. (The provisions of § 60.635(e) specify how to determine that a piece of equipment is not in VOC service.)

"In wet gas service" means that a compressor contains or contacts a process fluid that is less than 50 percent VOC by weight.

**§ 60.632-1 Standards: General.**

(a) Each owner or operator subject to the provisions of this subpart shall comply with the requirements of § 60.632-1 to § 60.632-9 for affected facilities within 180 days of initial startup.

(b) Compliance with § 60.632-1 to § 60.632-9 will be determined by review of records and reports, review of performance test results, and inspection using the methods and procedures specified in § 60.635.

(c)(1) An owner or operator may request determination of equivalent means of emission limitation to the requirements of § 60.632-2, -3, -4, -5, -6, -7, and -9 as provided in § 60.634.

(2) If the Administrator makes a determination that a means of emission limitation is at least equivalent to the requirements of § 60.632-2, -3, -4, -5, -6, -7, or -9, an owner or operator shall comply with the requirements of that determination.

(d) Equipment in vacuum service may be excluded from the requirements of § 60.632-2 to § 60.632-9 if they are identified as required in § 60.636(e)(3).

(e) Pumps in light of liquid service, valves in gas/vapor and light liquid service, and pressure relief devices in gas/vapor service that are located at an onshore natural gas processing plant that does not fractionate natural gas liquids and that does not have the design capacity to process 283,000 standard cubic meters per day (scmd) (10 million standard cubic feet per day (scfd)) or more of field gas are exempt from the routine monitoring requirements of § 60.632-2(a)(1), 60.632-4(a), and 60.632-6(a).

(f) Reciprocating compressors in wet gas service that are located at an onshore natural gas processing plant that does not have a control device present at the plant site are exempt from the compressor control requirements of § 60.632-3.

**§ 60.632-2 Standards: Pumps in light liquid service.**

(a)(1) Each pump seal in light liquid service shall be monitored monthly to detect leaks by the methods specified in § 60.635(b), except as provided in § 60.632-1(c) and paragraphs (d), (e), and (f) of this section.

(2) Each pump shall be checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seal.

(b)(1) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(2) If there are indications of liquids dripping from the pump seal, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but not later than 15 calendar days after it is detected except as provided in § 60.632-8.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) Each pump equipped with a dual mechanical seal system that includes a barrier fluid system is exempt from the requirements of paragraph (a), provided the following requirements are met:

(1) Each dual mechanical seal system is:

(i) Operated with the barrier fluid at a pressure that is at all times greater than the pump stuffing box pressure; or

(ii) Equipped with a barrier fluid degassing reservoir that is connected by a closed-vent system to a control device that complies with the requirements of § 60.632-9; or

(iii) Equipped with a closed vent system that purges the barrier fluid into a process stream with zero VOC emissions to the atmosphere.

(2) The barrier fluid system is in heavy liquid service or is not in VOC service.

(3) Each barrier fluid system is equipped with a sensor that will detect failure of the seal system, the barrier fluid system, or both.

(4) Each pump is checked by visual inspection, each calendar week, for indications of liquids dripping from the pump seal.

(5)(i) Each sensor as described in paragraph (d)(3) is checked daily or is equipped with an audible alarm, and

(ii) The owner or operator determines, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(6)(i) If there are indications of liquid dripping from the pump seal or the sensor indicates failure of the seal system, the barrier fluid system, or both, based on the criterion determined in paragraph (d)(5)(ii), a leak is detected.

(ii) When a leak is detected, it shall be required as soon as practicable, but not later than 15 calendar days after it is detected except as provided in § 60.632-8.

(iii) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(e) Any pump that is designated, as described in § 60.636(e)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (c), and (d) if the pump:

(1) Has no externally actuated shaft penetrating the pump housing,

(2) Is operated with no detectable VOC emissions, as indicated by an instrument reading of less than 500 ppm above background, as measured by the method specified in § 60.635(c), and

(3) Is tested for compliance with paragraph (e)(2) initially upon designation, annually, and at other times requested by the Administrator.

(f) If any pump is equipped with a closed-vent system capable of capturing and transporting any leakage from the seal or seals to a control device that complies with the requirements of § 60.632-9, it is exempt from paragraphs (a) through (e).

**§ 60.632-3 Standards: Compressors.**

(a) Each compressor shall be equipped with a closed-vent system capable of capturing and transporting any leakage from the seal vent and the distance piece area to a control device as described in § 60.632-9, except as provided in § 60.632-1(c) and paragraphs (b) through (i) of this section.

(b) Any compressor that is not equipped as described in paragraph (a) shall be equipped with a seal system that includes a barrier fluid system and that prevents leakage of VOC to the atmosphere.

(c) Each compressor seal system as required in paragraph (b) shall be:

(1) Operated with the barrier fluid at a pressure that is greater than the compressor stuffing box pressure; or

(2) Equipped with a barrier fluid system that is connected by a closed-vent system to a control device that complies with the requirements of § 60.632-9; or

(3) Equipped with a system that purges the barrier fluid into a process stream with zero VOC emissions to the atmosphere.

(d) The barrier fluid system shall be in heavy liquid service or shall not be in VOC service.

(e) Each barrier fluid system as described in paragraph (b) of this section shall be equipped with a sensor that will detect failure of the seal system, barrier fluid system, or both.

(f)(1) Each sensor as required in paragraph (e) shall be checked daily or shall be equipped with an audible alarm.

(2) The owner or operator shall determine, based on design considerations and operating experience, a criterion that indicates failure of the seal system, the barrier fluid system, or both.

(g) If the sensor indicates failure of the seal system, the barrier fluid system, or both, based on the criterion determined under paragraph (f)(2) of this section a leak is detected.

(h)(1) When a leak is detected, it shall be repaired as soon as practicable but no later than 15 calendar days after it is detected except as provided in § 60.632-8.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(i) Any compressor that is designed, as described in § 60.632(e)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph (a) through (h) of this section if the compressor:

(1) Is operated with no detectable emissions, as indicated by an instrument reading less than 500 ppm above background, as measured by the methods specified in § 60.635(c); and

(2) Is tested for compliance with paragraph (i)(1) initially upon designation, annually, and at other times requested by the Administrator.

**§ 60.632-4 Standards: Pressure relief devices in gas/vapor service.**

(a) Each pressure relief device shall be monitored quarterly and within 5 days after each pressure release to detect leaks by the methods specified in § 60.635-(b) except as provided in § 60.632-1(c).

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after it is detected, except as provided in § 60.632-8.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) Any pressure relief device that is designated, as described in § 60.636-(e)(2), for no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraphs (a), (b), and (c) of this section if the pressure relief device:

(1) Is operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, except during pressure releases, as measured by the method specified in § 60.635(c);

(2) After each pressure release, the pressure relief device shall be returned to a condition of no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background, as soon as practicable, but no later than 5 calendar days after the pressure release, except as provided in § 60.632-8; and

(3) Is tested for compliance initially, after each pressure release, annually,

and at other times requested by the Administrator.

(e) Any pressure relief device that is equipped with a closed-vent system capable of capturing and transporting all leakage from the pressure relief device to a control device that complies with the requirements of § 60.632-9 is exempt from paragraphs (a) through (d) of this section.

**§ 60.632-5 Standards: Open-ended valves or lines.**

(a)(1) Each open-ended valve or line shall be equipped with a cap, blind flange, plug, or a second closed valve, except as provided in § 60.632-1(c).

(2) The cap, blind flange, plug, or second closed valve shall seal the open end at all times except during sampling and other operations requiring process fluid flow through the open-ended valve or line.

(b) Each open-ended valve or line equipped with a second valve shall be operated in a manner such that the valve on the process fluid end is closed before the second valve is closed.

**§ 60.632-6 Standards: Valves in gas/vapor and light liquid service.**

(a) Each valve in gas/vapor and light liquid service shall be monitored monthly to detect leaks by the methods specified in § 60.635(b) and shall comply with paragraphs (b) through (e) of this section, except as provided in paragraphs (f) and (g) of this section, § 60.633-1 and -2, and § 60.632-1(c).

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) Any valve for which a leak is not detected for 2 successive months may be monitored the first month of every quarter, beginning with the next quarter, until a leak is detected.

(2) If a leak is detected, the valve shall be monitored monthly until a leak is not detected for 2 successive months.

(d)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after the leak is detected, except as provided in § 60.632-8.

(2) A first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(e) First attempts at repair include, but are not limited to, the following best practices where practicable:

- (1) Tightening of bonnet bolts.
- (2) Replacement of bonnet bolts.
- (3) Tightening of packing gland nuts.
- (4) Injection of lubricant into lubricated packing.

(f) Any valve that is designated, as described in § 60.636(e)(2), for no detectable emissions, as indicated by an

instrument reading of less than 500 ppm above background, is exempt from the requirements of paragraph(a) if the valve:

(1) Has no external actuating mechanism in contact with the process fluid.

(2) Is operated with emissions less than 500 ppm above background, as measured by the method specified in § 60.635(c), and

(3) Is tested for compliance initially upon designation, annually, and at other times requested by the Administrator.

(g) Any valve that is designated, as required in § 60.636(f)(2), as a difficult-to-monitor valve is exempt from the requirements of paragraph(a) if:

(1) The owner or operator of the valve demonstrates that the valve cannot be monitored without elevating the monitoring personnel more than 2 meters above a support surface.

(2) The process unit within which the valve is located becomes an affected facility through § 60.14 or § 60.15, and

(3) The owner or operator of the valve has a written plan that requires monitoring of the valve at least once per calendar year.

**§ 60.632-7 Standards: Pumps and valves in heavy liquid service, pressure relief devices in light liquid and in heavy liquid service, and flanges and other connectors.**

(a) Pumps and valves in heavy liquid service, pressure relief devices in light liquid and in heavy liquid service, and flanges and other connectors shall be monitored within 5 days, by the method specified in § 60.635(b), after evidence of a potential leak is found by visual, audible, olfactory, or other detection method.

(b) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(c)(1) When a leak is detected, it shall be repaired as soon as practicable, but no later than 15 calendar days after it is detected, except as provided in § 60.632-8.

(2) The first attempt at repair shall be made no later than 5 calendar days after each leak is detected.

(d) First attempts at repair include, but are not limited to, the best practices described under § 60.632-6(e).

**§ 60.632-8 Standards: Delay of repair.**

(a) Delay of repair of compressors and equipment for which leaks have been detected will be allowed if the repair is technically infeasible without a process unit shutdown. Repair of this equipment shall occur, however, at the first process unit shutdown.

(b) Delay of repair beyond a process unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the next process unit shutdown will not be allowed unless the next process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

**§ 60.632-9 Standards: Closed-vent systems and control devices.**

(a) Owners or operators of closed-vent systems and control devices used to comply with provisions of this subpart shall comply with the provisions of this section.

(b) Vapor recovery systems (for example, condensers and adsorbers) shall be designed and operated to recover the VOC emissions vented to them with an efficiency of 95 percent or greater.

(c) Enclosed combustion devices shall be designed and operated to reduce the VOC emissions vented to them with an efficiency of 95 percent or greater or to provide a minimum residence time of 0.75 seconds at a minimum temperature of 816°C.

(d)(1) Flares shall be designed for and operated with no visible emissions, as determined by the method in § 60.635(g), except for periods not to exceed a total of 5 minutes during any period of 2 consecutive hours.

(2) Flares shall be operated with a flame present at all times, as determined by the method specified in § 60.635(g).

(3) Flares shall be used only with the net heating value of the gas being combusted being 11.2 MJ/scm (300 Btu/scf) or greater if the flare is steam-assisted or air-assisted; or with the net heating value of the gas being combusted being 7.45 MJ/scm or greater if the flare is non-assisted. The net heating value of the gas being combusted shall be determined by the methods specified in § 60.635(g).

(4) Steam-assisted and non-assisted flares shall be designed for and operated with an exit velocity, as determined by the methods specified in § 60.635(g)(4), less than 18 m/sec (60 ft/sec).

(5) Air-assisted flares shall be designed and operated with an exit velocity less than the velocity,  $V_{max}$ , as determined by the methods specified in § 60.635(g)(5).

(6) Flares used to comply with this subpart shall be steam-assisted, air-assisted, or non-assisted.

(e) Owners or operators of control devices used to comply with the provisions of this subpart shall monitor these control devices to ensure that they are operated and maintained in conformance with their design.

(f)(1) Closed-vent systems shall be designed and operated with no detectable emissions, as indicated by an instrument reading of less than 500 ppm above background and by visual inspections, as determined by the method specified in § 60.635(c).

(2) Closed-vent systems shall be monitored to determine compliance with this section initially in accordance with § 60.8, annually, and at other times requested by the Administrator.

(g) Closed-vent systems and control devices used to comply with provisions of this subpart shall be operated at all times when emissions may be vented to them.

**§ 60.633-1 Alternative standards for valves—allowable percentage of valves leaking.**

(a) An owner or operator may elect to comply with an allowable percentage of valves leaking, which is equal to or less than 2.0 percent.

(b) The following requirements shall be met if an owner or operator wishes to comply with an allowable percentage of valves leaking:

(1) An owner or operator must notify the Administrator that the owner or operator has elected to comply with the allowable percentage of valves leaking before implementing this alternative standard, as specified in § 60.637(a).

(2) A performance test as specified in paragraph (c) of this section shall be conducted initially upon designation, annually, and at other times requested by the Administrator.

(3) If a valve leak is detected, it shall be repaired in accordance with § 60.632-6 (d) and (e).

(c) Performance tests shall be conducted in the following manner:

(1) All valves in gas/vapor and light liquid service within the affected facility shall be monitored within a 1 week period by the methods specified in § 60.635(b).

(2) If an instrument reading of 10,000 ppm or greater is measured, a leak is detected.

(3) The leak percentage shall be determined, and recorded, by dividing the number of valves for which leaks are detected by the number of valves in gas/vapor and light liquid service within the affected facility.

(d) Owners and operators who elect to comply with this alternative standard shall not have an affected facility with a leak percentage greater than 2.0 percent.

(e) If an owner or operator no longer wishes to comply with § 60.633-1, the owner or operator must notify the Administrator in writing that the work practice standard described in § 60.632-6 (a) through (e) will be followed.

**§ 60.633-2 Alternative standards for valves—skip period leak detection and repair.**

(a)(1) An owner or operator may elect to comply with one of the alternative work practices specified in paragraph (b) of this section.

(2) An owner or operator must notify the Administrator before implementing one of the alternative work practices, as specified in § 60.637(a).

(b)(1)(i) An owner or operator shall comply with a reference leak detection program.

(ii) The reference leak detection program shall conform to the requirements for valves in gas/vapor service and valves in light liquid service, as described in § 60.632-6.

(2) After 2 consecutive quarterly leak detection periods with the percent valves leaking equal to or less than 2.0, an owner or operator may begin to skip 1 of the quarterly leak detection periods.

(3) After 5 consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0, an owner or operator may begin to skip 3 of the quarterly leak detection periods.

(4) If the percent of valves leaking is greater than 2.0, the owner or operator shall comply with the reference leak detection program, as described in § 60.632-6, but can again elect to use paragraphs (b)(2) or (b)(3) of this section.

(5) An owner or operator must keep a record of the percent of valves found leaking during each leak detection period.

**§ 60.634 Equivalent means of emission limitation.**

(a) Each owner or operator subject to the provisions of this subpart may apply to the Administrator for determination of equivalence for any means of emission limitation that achieves a reduction in emissions of VOC at least equivalent to the reduction in emissions of VOC achieved by the controls required in this subpart.

(b) Determination of equivalence to the equipment, design, and operational requirements of this subpart will be evaluated by the following guidelines:

(1) Each owner or operator applying for an equivalence determination shall be responsible for collecting and verifying test data to demonstrate

equivalence of any means of emission limitation.

(2) The Administrator will compare test data for the equivalent means of emission limitation to test data for the equipment, design, and operational requirements.

(3) The Administrator may condition the approval of equivalence or requirements that may be necessary to assure operation and maintenance to achieve the same emission reduction as the equipment, design, and operational requirements.

(c) Determination of equivalence to the required work practices in this subpart will be evaluated by the following guidelines:

(1) Each owner or operator applying for a determination of equivalence shall be responsible for collecting and verifying test data to demonstrate equivalence of any means of emission limitation.

(2) For each affected facility for which a determination of equivalence is requested, the emission reduction achieved by the required work practice shall be demonstrated for a minimum period of 12 months.

(3) For each affected facility, the emission reduction achieved by the equivalent means of emission limitation shall be demonstrated.

(4) Each owner or operator applying for a determination of equivalence shall commit to compliance with a performance that provides for emission reductions equal to or greater than the emission reductions achieved by the required work practice.

(5) The Administrator will compare the demonstrated emission reduction for the equivalent means of emission limitation to the demonstrated emission reduction for the required work practice and will consider the commitment in paragraph (c)(4) of this section.

(6) The Administrator may condition the approval of equivalence on requirements that may be necessary to assure operation and maintenance to achieve the same emission reduction as the required work practice.

(d) An owner or operator may offer a unique approach to demonstrate the equivalence of any means of emission limitation.

(e)(1) After a request for determination of equivalence is received, the Administrator will publish a notice in the *Federal Register* and provide the opportunity for a public hearing if the Administrator judges that the request may be approved.

(2) After notice and opportunity for a public hearing, the Administrator will determine the equivalence of any means of emission limitation and will publish

the determination in the *Federal Register*.

(3) Any equivalent means of emission limitation approved under this section shall constitute a required work practice, equipment, design, or operational standard within the meaning of Section 111(h)(1) of the Clean Air Act.

(f)(1) Manufacturers of equipment used to control equipment leaks of VOC may apply to the Administrator for determination of equivalence for any means of emission limitation that achieves a reduction in emissions of VOC achieved by the equipment, design, and operational requirements of this subpart.

(2) The Administrator will make an equivalence determination according to the provisions of paragraphs (b), (c), (d), and (e) of this section.

#### § 60.635 Test methods and procedures.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the test method and procedure requirements provided in this section.

(b) Monitoring, as required in § 60.632, § 60.633, and § 60.634, shall comply with the following requirements:

(1) Monitoring shall comply with Reference Method 21.

(2) The detection instrument shall meet the performance criteria of Reference Method 21.

(3) The instrument shall be calibrated before use on each day of its use by the methods specified in Method 21.

(4) Calibration gases shall be:

(i) Zero air (less than 3 ppm of hydrocarbon in air); and

(ii) A mixture of methane or n-hexane and air at a concentration of approximately, but less than, 10,000 ppm methane or n-hexane.

(5) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(c) When compressors or equipment are tested for compliance with no detectable emissions as required in § 60.632-2(e), -3(i), -4(d), -6(f), and -9(f), the test shall comply with the following requirements:

(1) The requirements of paragraphs (b)(1) through (5) of this section shall apply.

(2) The background level shall be determined, as set forth in Reference Method 21.

(3) The instrument probe shall be traversed around all potential leak interfaces as close to the interface as possible as described in Reference Method 21.

(4) The arithmetic difference between the maximum concentration indicated by the instrument and the background level is compared with 500 ppm for determining compliance.

(d)(1) Equipment is in heavy liquid service if the weight percent evaporated is 10 percent or less at 150°C as determined by ASTM Method (incorporated by reference as specified in § 60.17).

(2) Equipment is in light liquid service if the weight percent evaporated is greater than 10 percent at 150°C as determined by ASTM Method D-86 (incorporated by reference as specified in § 60.17).

(e)(1) Each piece of equipment within a process unit is presumed to be in VOC service unless an owner or operator demonstrates that the piece of equipment is not in VOC service. For a piece of equipment to be considered not in VOC service, it must be determined that the percent VOC content can be reasonably expected never to exceed 1.0 percent by weight. For a compressor to be considered in wet gas service, it must be determined that the percent VOC content is less than 50.0 percent by weight. For purposes of determining the percent VOC content of the process fluid that is contained in or contacts a compressor or equipment, procedures that conform to the methods described in ASTM Method E-260, E-168, or E-169 (incorporated by reference as specified in § 60.17) shall be used.

(2) If an owner or operator decides to exclude nonreactive organic compounds from the percent VOC content of the process fluid, the exclusion will be allowed, provided:

(i) Those substances excluded are those considered by the Administrator as having negligible photochemical reactivity; and

(ii) The owner or operator demonstrates that the percent VOC content, excluding nonreactive organic compounds, can be reasonably expected never to exceed 1.0 percent VOC by weight.

(3)(i) An owner or operator may use engineering judgment rather than the procedures in paragraphs (e) (1) and (2) of this section to demonstrate that the VOC content does not exceed 1.0 weight percent provided that the engineering judgment demonstrates that the VOC content clearly does not exceed 1.0 weight percent. When an owner or operator and the Administrator do not agree on whether a piece of equipment is not in VOC service, however, the procedures in paragraphs (e) (1) and (2) of this section shall be used to resolve the disagreement.

(ii) If an owner or operator determines that a piece of equipment is in VOC service, that determination can be revised only after following the procedures in paragraph (e) (1) and (2) of this section.

(f) Samples used in conjunction with paragraphs (d) and (e) shall be representative of the process fluid that is contained in or contacts the equipment.

(g)(1) Reference Method 22 shall be used to determine the compliance of flares with the visible emission provisions of this subpart.

(2) The presence of a flare pilot flame shall be monitored using a thermocouple or any other equivalent device to detect the presence of a flame.

(3) The net heating value of the gas being combusted in a flare shall be calculated using the following equation:

$$H_T = K \left( \sum_{i=1}^n C_i H_i \right)$$

where:

$H_T$  = Net heating value of the sample, MJ/scm; where the net enthalpy per mole of offgas is based on combustion at 25°C and 760 mm Hg, but the standard temperature for determining the volume corresponding to one mole is 20°.

$K$  = Constant,

$$1.740 \times 10^7 \left( \frac{1}{\text{ppm}} \right) \left( \frac{\text{g mole}}{\text{scm}} \right) \left( \frac{\text{MJ}}{\text{kcal}} \right)$$

where standard temperature for

$$\left( \frac{\text{g mole}}{\text{scm}} \right)$$

is 20°C.

$C_i$  = Concentration of sample component  $i$  in ppm, as measured by Reference Method 18 and ASTM D2504-67 (reapproved 1977) (incorporated by reference as specified in § 60.17).

$H_i$  = Net heat of combustion of sample component  $i$ , kcal/g mole. The heats of combustion may be determined using ASTM D2382-76 (incorporated by reference as specified in § 60.17) if published values are not available or cannot be calculated.

(4) The actual exit velocity of a flare shall be determined by dividing the volumetric flowrate (in units of standard temperature and pressure), as determined by Reference Method 2, 2A or 2C, as appropriate; by the unobstructed (free) cross sectional area of the flare tip.

(5) The maximum permitted velocity,  $V_{\max}$ , for air-assisted flares shall be determined by the following equation:

$$V_{\max} = 8.706 + 0.7084 (H_T)$$

$V_{\max}$  = Maximum permitted velocity, m/sec.

8.706 = Constant.

0.7084 = Constant.

$H_T$  = The net heating value as determined in paragraph (g)(4).

(Sec. 114 of the Clean Air Act as amended (42 U.S.C. 7414))

#### § 60.636 Recordkeeping requirements.

(a) Each owner or operator subject to the provisions of this subpart shall comply with the recordkeeping requirements of this

(b) When each leak is detected as specified in §§ 60.632-2, -3, -4, -6, and -7, the following requirements apply:

(1) A weatherproof and readily visible identification, marked with the equipment identification number, shall be attached to the leaking equipment.

(2) The identification on a valve may be removed after it has been monitored for 2 successive months as specified in § 60.632-6(c) and no leak has been detected during those 2 months.

(3) The identification on a compressor or equipment, except on a valve, may be removed after it has been repaired.

(c) When each leak is detected as specified in §§ 60.632-2, 60.632-3, 60.632-4, 60.632-6, and 60.632-7, the following information shall be recorded in a log and shall be kept for 2 years in a readily accessible location:

(1) The instrument and operator identification numbers and the equipment identification number.

(2) The date the leak was detected and the dates of each attempt to repair the leak.

(3) Repair methods applied in each attempt to repair the leak.

(4) "Above 10,000 ppm" if the maximum instrument reading measured by the methods specified in § 60.635(a) after each repair attempt is 10,000 ppm or greater.

(5) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 calendar days after discovery of the leak.

(6) The signature of the owner or operator (or designate) whose decision it was that repair could not be effected without a process shutdown.

(7) The expected date of successful repair of the leak if a leak is not repaired within 15 days.

(8) Dates of process unit shutdowns that occur while the equipment is unrepaired.

(9) The date of successful repair of the leak.

(d) The following information pertaining to the design requirements for closed-vent systems and control devices described in § 60.632-9 shall be recorded and kept in a readily accessible location:

(1) Detailed schematics, design specifications, and piping and instrumentation diagrams.

(2) The dates and descriptions of any change in the design specifications.

(3) A description of the parameter or parameters monitored, as required in § 60.632-9(e) to ensure that control devices are operated and maintained in conformance with their design and an explanation of why the parameter (or parameters) was selected for the monitoring.

(4) Periods when the closed-vent systems and control devices specified in §§ 60.632-2, 60.632-3, 60.632-4 are not operated as designed, including periods when a flare pilot light does not have a flame.

(5) Dates of startups and shutdowns of the closed-vent systems and control devices specified in §§ 60.632-2, 60.632-3, 60.632-4.

(e) The following information pertaining to all compressors and equipment subject to the requirements in §§ 60.632-2, 60.632-3, 60.632-4, and 60.632-6 shall be recorded in a log that is kept in a readily accessible location:

(1) A list of identification numbers for equipment subject to the requirements of this subpart.

(2)(i) A list of identification numbers for equipment that the owner or operator elects to designate for no detectable emissions under the provisions of §§ 60.632-2(e), 60.632-3(i), 60.632-4(d), and 60.632-6(f).

(ii) The designation of this equipment as subject to the requirements of §§ 60.632-2(e), 60.632-3(i), 60.632-4(d), or 60.632-6(f) shall be signed by the owner or operator.

(3)(i) The dates of each compliance test as required in §§ 60.632-2(e), 60.632-3(i), 60.632-4(d), and 60.632-6(f).

(ii) The background level measured during each compliance test.

(iii) The maximum instrument reading measured at the equipment during each compliance test.

(4) A list of identification numbers for equipment that are in vacuum service.

(f) The following information pertaining to all valves subject to the requirements of § 60.632-6(g) shall be recorded in a log that is kept in a readily accessible location:

(1) A list of identification numbers for valves that are designated as difficult to monitor,

(2) An explanation for each valve stating why the valve is difficult to monitor, and

(3) The expected date for monitoring each valve.

(g) The following information shall be recorded in a log that is kept in a readily accessible location:

(1) Design criterion require in § 60.632-2(d)(5) and 60.632-3(f)(2), and an explanation of the design criterion; and

(2) Any changes to this criterion and the reasons for this change.

(3) An analysis demonstrating the design capacity of the natural gas processing plant.

(h) Each owner or operator electing to comply with the provisions of § 60.632-8 shall maintain records of the date, duration, and purpose of each shutdown.

(i) Information and data used to demonstrate that a piece of equipment is not in VOC service shall be recorded in a log that is kept in a readily accessible location.

(j) Information and data used to demonstrate that a reciprocating compressor is in wet gas service to apply for the exemption in § 60.632-1(f) shall be recorded in a log that is kept in a readily accessible location.

(k) The provisions of § 60.7(b) and (d) do not apply to affected facilities subject to this subpart.

(Sec. 114 of the Clean Air Act as amended (42 U.S.C. 7414))

#### § 60.637 Reporting requirements.

(a) Each owner or operator subject to the provisions of this subpart shall submit semiannual reports to the Administrator, beginning 6 months after the initial startup date.

(b) The initial semiannual report to the Administrator shall include the following information:

(1) Process unit identification.

(2) Number of valves subject to the requirements of § 60.632-6 or § 60.633, excluding those valves designated for no detectable emissions under the provisions of § 60.632-6(f).

(3) Number of pumps subject to the requirements of § 60.632-2, excluding those pumps designated for no detectable emissions under the provisions of § 60.632-2(e) and those pumps complying with § 60.632-2(f).

(4) Number of compressors subject to the requirements of § 60.632-3(b)-(h).

(5) Number of pressure relief devices subject to the requirements of § 60.632-4, except those pressure relief devices designated for no detectable emissions under the provisions of § 60.632-4(d), and those pressure relief devices complying with § 60.632-4(e).

(c) All semiannual reports to the Administrator shall include the following information, summarized from the information recorded in § 60.636:

(1) Process unit identification.

(2) For each month during the semiannual reporting period,

(i) Number of valves for which leaks were detected as described in § 60.632-6(b) or 60.633-2.

(ii) Number of valves for which leaks were not repaired as required in § 60.632-6(d).

(iii) Number of pumps for which leaks were detected as described in § 60.632-2 (b) and (d)(6).

(iv) Number of pumps for which leaks were not repaired as required in § 60.632-2 (c) and (d)(6).

(v) Number of compressors for which leaks were detected as required in § 60.632-3(g).

(vi) Number of compressors for which leaks were not repaired as required in § 60.632-3(h).

(vii) Number of pressure relief devices for which leaks were detected as required in § 60.632-4(b).

(viii) Number of pressure relief devices for which leaks were not repaired as required in § 60.632-4(c).

(ix) The facts that explain each delay of repair and, where appropriate, why a process unit shutdown was technically infeasible.

(3) Dates of process unit shutdowns which occurred within the semiannual reporting period.

(4) Revisions to items reported according to paragraph (b) of this section if changes have occurred since the initial report or subsequent revisions to the initial report.

(d) An owner or operator electing to comply with the provisions of §§ 60.633-1 and 60.633-2 shall notify the Administrator of the alternative standard selected 90 days before implementing either of the provisions.

(e) An owner or operator shall report the results of all performance tests in accordance with § 60.8 of the General Provisions. The provisions of § 60.8(d) do not apply to affected facilities subject to the provision of this subpart, except that an owner or operator shall notify the Administrator of the schedule for the initial performance tests at least 30 days before the initial performance tests.

(f) The requirements of paragraphs (a) through (c) of this section remain in force until and unless EPA, in delegating enforcement authority to a State under Section 111(c) of the Act, approves reporting requirements or an alternative means of compliance surveillance adopted by such State. In that event, affected sources within the State will be relieved of the obligation to comply with paragraphs (a) through (c) of this section, provided that they comply with the requirements established by the State.

(Sec. 114 of the Clean Air Act as amended (42 U.S.C. 7414))

#### Standards of Performance for New Stationary Sources; Onshore Natural Gas Processing SO<sub>2</sub> Emissions From Onshore Natural Gas Processing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule and notice of public hearing.

**SUMMARY:** The proposed standards would limit atmospheric emissions of sulfur dioxide (SO<sub>2</sub>) from new, modified, and reconstructed sweetening and sulfur recovery units in the natural gas production industry. The standards do not regulate sulfur content in natural gas; instead, they apply only to SO<sub>2</sub> emissions from gas processing (sweetening and sulfur recovery) facilities. Standards that limit volatile organic compounds (VOC) from the natural gas production industry are also being proposed in a separate Federal Register notice.

The standards implement Section 111 of the Clean Air Act and are based on the Administrator's determination that the crude oil and natural gas production industry contributes significantly to air pollution that may reasonably be anticipated to endanger public health or welfare. The intended effect is to require new, modified, and reconstructed affected facilities in the natural gas production industry to reduce emissions by using the best demonstrated system(s) of continuous emissions reduction, considering costs, nonair quality health, and environmental and energy impacts.

A public hearing will be held, if requested, to provide interested persons an opportunity for oral presentation of
